All Hella devices have E type approval.
Exceptions to this are devices with national type approval that are only marked for Germany and equipment for local authority vehicles.
See overview of type approval numbers in Chapter 9.

What does GGVS/ADR mean?

Some headlights and lights in the range are marked with this symbol. This means that these products are approved for mounting to transport equipment which complies with the requirements of GGVS/ADR B Rn 10251 and Rn 11251 for electrical equipment.

GGVS
Act governing the transportation of hazardous goods by road

ADR
Accord européen relatif au transport international des merchandises dangereuses par route (European Agreement concerning the International Carriage of Dangerous Goods by Road)

What do the IP protective ratings mean?

Protective rating IP5K4K
Dust may only penetrate to such an extent that function and safety are not impaired.
Water being sprayed against the housing at increased pressure may not have a harmful effect; water pressure approx. 4 bar.

Protective rating IP6K4K
Dust must not penetrate.
Water being sprayed against the housing at increased pressure may not have a harmful effect; water pressure approx. 4 bar.

Protective rating IPX9K
Water that is directed against the housing during high-pressure/steam jet cleaning may not have a harmful effect; water pressure approx. 80 bar.

Decisive for the specification of the protective rating are the splashwater test and the dust test

The splash-water test provides information about how headlights, lights and beacons resist rain, splashwater, mud and high-pressure cleaners.
For this purpose, water is sprayed constantly onto the test specimen in a closed chamber as if through a high-pressure cleaner.

The dust test examines the degree to which the test specimen is protected against penetration by solid particles including dust.
For this purpose, the test sample is exposed to a flow of dust/air mixture for a certain length of time in the chamber.

Informations
for headlights with protection caps

Protective caps are not allowed by law in some countries.
Please check with the appropriate authorities before use on public roads.
Under German law (StVZO), headlights must be ready for operation at all times when driving on public roads.
Violation of this regulation is an offence.
The correct function of these lamp failure checks can only be determined by the vehicle manufacturer.

Informations
for LED headlights

In connection with these low power ratings, which differ significantly from those of a bulb-based version, problems arise with indicator failure control on various traction vehicles, because further light functions are detected by some traction vehicles. This is a comfort function of the vehicle which is not required by law and does not release the driver from its duty to visually check the lighting system. The failure control of an LED headlight demanded by law within the scope of ECE R48 has to be ensured in the vehicle by suitable measures. The customer is responsible for this.
Here as well, faulty diagnosis may occur due to the small power (instrument panel in the driver's cab shows lamp failure although function is OK).
The functional ability of these light failure checks can only be established by the vehicle manufacturer.

Operation of the LED headlight with alternating voltage or clocked direct voltage is not permitted!
The individual functions of a headlight must only be operated with an onboard fuse of max. 10A (vehicle-specific 5A).

In the case of onboard current limitation with the values specified above by the onboard control unit an additional fuse for the headlight is not required.

Why work lights?

**Working at night -
no problem with the right headlights.**

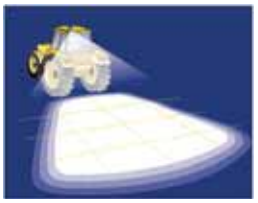
**Special headlight types have been developed for this purpose:
Low-beam headlights and spotlights:
for illuminating the road in road traffic.
Fog lights:
for poor visibility conditions in road traffic.
Work lights:
for the illumination of a working area near the vehicle and away from public road traffic.**

Low beam

Spotlight

**At the mounting height typical for work lighting (2.50 m), only worklights provide sufficient illumination of the working area. Standard vehicle lighting is nowhere near good enough!
Outstanding features of a good worklight include the homogeneous illumination of as large an area as possible and a soft transition at the edge.**

Fog light



Work light

Active safety through proper illumination!

**It's not only the selection of the correct type of headlight that is decisive for the choice of optimum worklight, but its correct positioning on the vehicle, too.
Worklights shine at an angle to the surface they are illuminating. This means that even small changes in the angle of inclination and the mounting height have a great influence on the illumination of the working area.
For large-surface illumination, the higher the mounting position the better.**

**low
mounting position**

**high
mounting position**

**Legal notes:
According to FMVSS § 52 (7) [Germany], all multi-track vehicles may be equipped with one or more worklights.
Worklights must not be used when these vehicles are being driven on public roads, only when they are at a standstill, e.g. during loading and unloading.**

**Exceptions to this are made for vehicles used for constructing, maintaining or cleaning the roads or for waste disposal vehicles, if the action of driving is part of a working process.
Worklights may only be switched on as long as they do not dazzle other road users.**

Worklights must be able to be switched on independently of all other headlights or lights, e.g. joint circuitry with the reverse light is not permitted. Hella provides special reversing spotlights for this purpose.

There are no special approval regulations, e.g. according to ECE or EC, since worklights may only be used when driving away from public roads.

Instruction 1 - Regarding LED technology multi-function lamps

**In connection with these low powers, which are very different from bulb versions, there can be problems with the bulb failure check during operation on various traction vehicles.
Since indicator failure checks are required by legislation, we recommend only operating the light in combination with an indicator control unit part no. "5DS 009 602-..., 5DS 009 552-... or LED flasher unit 4.. 009 492".
In addition, further lighting functions are detected by some traction vehicles.
This is a vehicle comfort function which is not required by legislation and does not release drivers from their obligation to see for themselves that the lighting equipment is working.
Here, too, faulty diagnoses can be a result of the lower power levels involved (instrument panel in the driver cab indicates a bulb failure although the function is working).**

**Operation of the light with alternating current or pulsed direct current is not permitted!
The functional ability of these light failure checks can only be established by the vehicle manufacturer.
The individual light functions may only be operated with a vehicle fuse of max. 3A.**

In the case of onboard current limitation with the values specified above by the onboard control unit an additional fuse for the lamp is not required.

Instruction 2 - Regarding single or double function lamps with LEDs without flasher function

**In connection with these low powers, which are very different from bulb versions, there can be problems during operation on various traction vehicles because further lighting functions are detected by some traction vehicles.
This is a vehicle comfort function which is not required by legislation and does not release drivers from their obligation to see for themselves that the lighting equipment is working.
Here, too, faulty diagnoses can be a result of the lower power levels involved (instrument panel in the driver cab indicates a bulb failure although the function is working).
The functional ability of these light failure checks can only be established by the vehicle manufacturer.**

**Operation of the light with alternating current or pulsed direct current is not permitted!
The individual light functions may only be operated with a vehicle fuse of max. 3A.**

In the case of onboard current limitation with the values specified above by the onboard control unit an additional fuse for the lamp is not required.

Instruction 3 - Regarding flasher lights with LEDs with active electronics

**In connection with these low powers, which are very different from bulb versions, there can be problems with the bulb failure check during operation on various traction vehicles.
Since indicator failure checks are required by legislation, we recommend only operating the light in combination with an indicator control unit part no. "5DS 009 602-..., 5DS 009 552-... or LED flasher unit 4.. 009 492".**

**Operation of the light with alternating current or pulsed direct current is not permitted!
The individual light functions may only be operated with a vehicle fuse of max. 3A.**

Instruction 4 - Regarding flasher lights with LEDs with passive electronics

**In connection with these low powers, which differ significantly from those of a bulb-based version, problems arise with the indicator failure check during operation on various traction vehicles.
The indicator failure check required by legislation in the area of validity of the ECE R48 regulation must be guaranteed by suitable measures within the vehicle. The customer is responsible for this.**

**In addition, further lighting functions are detected by some traction vehicles.
This is a vehicle comfort function which is not required by legislation and does not release drivers from their obligation to see for themselves that the lighting equipment is working.
Here, too, faulty diagnosis can occur on account of the low power levels involved (instrument panel in the driver cab indicates light failure although the function is working).**

**Operation of the light with AC voltage or synchronised DC voltage is not permitted.
The individual light functions may only be operated with a vehicle fuse of max. 3A.**

Failure control for LED indicators

Legal requirement in all ECE states

In the case of vehicles approved for use on public roads, the indicators must be monitored:
The failure of an indicator must be shown optically or acoustically in the vehicle.
This applies in all ECE states. In other words, the potential failure of the indicator must be monitored by the vehicle. Manufacturers use various failure control systems.
The failure control systems currently in use cannot detect simple LED lights and displays a fault. All Hella LED indicators have integrated electronics for failure control.
The indicators are selfmonitoring.
They generate a pulse that is evaluated by the electronic ballast.
The ballast simulates a 21W bulb, which makes operation with conventional flasher units possible.

As soon as one single LED fails, the light can be considered faulty, the pulse is not generated. The ballast then switches the bulb simulation off and the flasher unit indicates the fault to the driver.

Safe conversion to LED indicators now possible thanks patented Hella electronics

Hella supplies electronic ballasts for all Hella LED indicators which make it possible to convert the indicator failure display for various vehicles. This is necessary if the vehicle manufacturer does not guarantee indicator bulb failure control via the vehicle wiring system.
The method has been patented for Hella. At the moment, there are three different ballasts and several different LED indicator types available.

LED indicator failure control: Background information

Why does the failure detection required by law work with various LED lights with some flasher units and not with others?

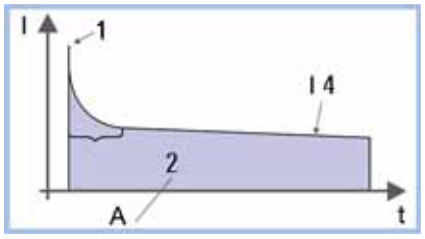

Fig. 1

Fig. 1 illustrates the typical current pattern when a bulb is switched on.
Different flasher units detect this in different ways, for example by
a) measuring the pulse peak or
b) measuring the current at some point during the switch-on pulse or
c) measuring the current after the pulse, when the current is constant and has a certain intensity, or
d) determining the total energy flowing through the light (size of area A)

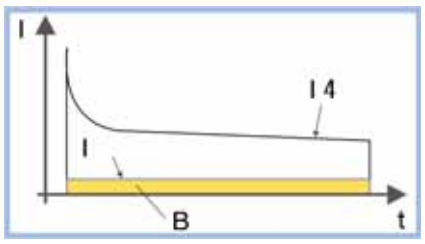

Fig. 2

Fig. 2 shows the LED current (I LED) in relation to this. None of the methods mentioned above can work here, because there is neither a switch-on pulse available nor is the current intensity high enough or the toal energy through both lights is identical (area B is as large as A).

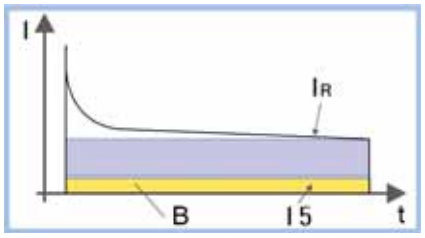

Fig. 3

If a simple Ohmic resistor is inserted, e.g. a resistor cable, the current is increased by a certain value (IR) and the curve illustrated in Fig. 3 is the result.
In this case, only a flasher unit according to principe c) would work.
If the resistance is chosen somewhat higher, principle d) could also possibly work.
If the light fails afterwards due to mechanical damage, the flasher unit could detect the insert resistor as a functional bulb. In this case, a light working perfectly would be indicated although this is not the case!
This means: In this case the vehicle would lose this approval for use on public roads.

The only solution conceivable for universl use is one that works with all the flasher units on the market. As the above considerations have shown, this can practically only be guaranteed if the current pattern of a bulb is simulated exactly be means of an electronic circuit.

I = Current
t = Time
1 = Pulse peak
2 = Switch-on pulse
3 = Individual pulse
4 = Bulb
5 = LED

Since such a circuit is extremely complex, it is not possible to integrate this in the LED light. In order to be able to benefit from the advatages of LED lights despite this fact, a ballast is required to the circuit. This combination provides the perfect - and above all legally conform - solution to the problem.

Failure control for LED indicators

Hella patent for the perfect problem solution

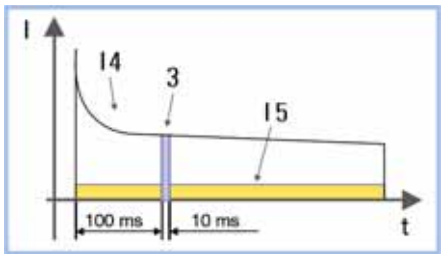

Fig. 4

I = Current
t = Time
1 = Pulse peak
2 = Switch-on pulse
3 = Individual pulse
4 = Bulb
5 = LED

All Hella LED indicators with integrated electronics for failure control are self-monitoring and generate an individual pulse. This pulse is evaluated by the electronic ballasts.
The ballasts simulate a 21W bulb.
This makes operation with conventional flasher units possible.
If the light is faulty, which can be the case if only a single LED fails, the above-mentioned pulse is not generated.
The ballasts then switch the bulb simulation off and the flasher unit indicates the LED fault to the driver.

By measuring the light current during a time window of 10 ms (Fig. 4), direct exchange between the Hella LED light and a bulb version is possible.

Hella ballasts are straightforward to convert even at a later date.

Vehicle manufacturers can also ensure ECE-conform failure control by evaluating the pulse of the Hella LED indicators shown in the adjacent diagram directly in their control units.
The exact specification can be obtained from Hella.
