Контур охлаждающей жидкости

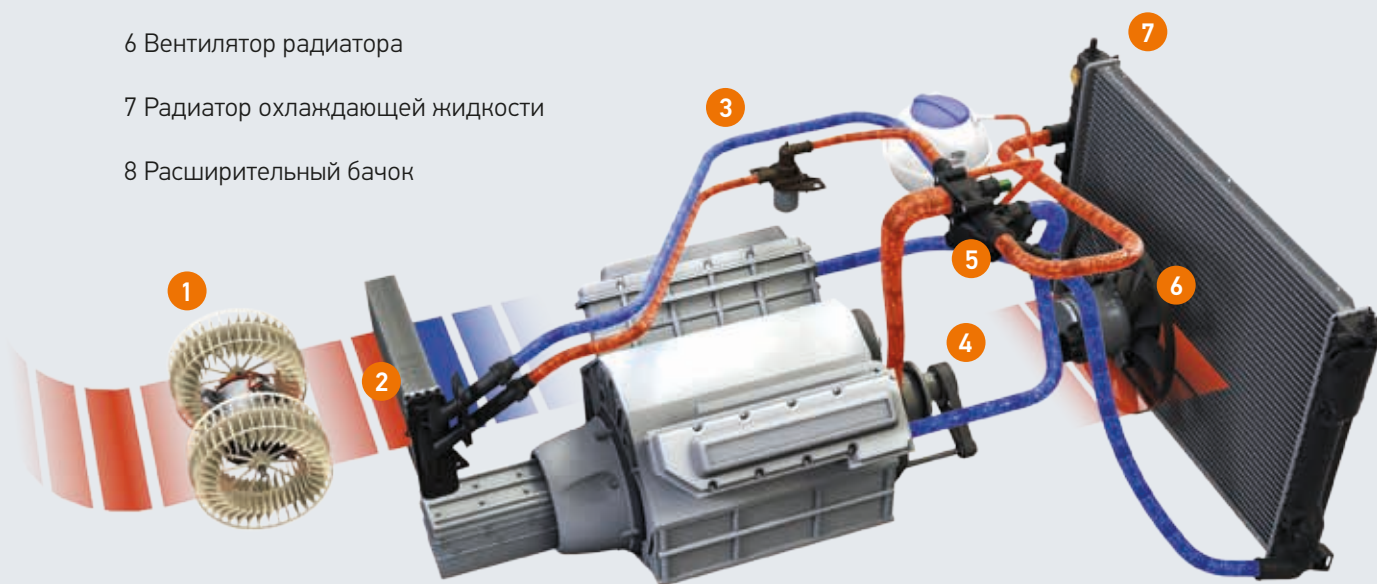

Задачей системы охлаждения двигателя является охлаждение двигателя и отвод тепловой энергии в атмосферу. Одновременно при работе двигателя образуется тепло, которое можно использовать для обогрева салона автомобиля.

Система охлаждения двигателя и климатическая установка являются двумя отделенными друг от друга системами, которые, однако, оказывают друг на друга влияние. Отдельные компоненты контура хладагента соединены патрубком и образуют закрытую систему. В этой системе циркулирует охлаждающая жидкость, приводимая в движение механическим или электрическим насосом.

Возникающая при сгорании топлива тепловая энергия, которая передается на компоненты двигателя, отдается охлаждающей жидкости.

Посредством циркуляции тепло отводится в атмосферу, и тем самым охлаждающая жидкость охлаждается. Один или несколько вентиляторов (с механическим или электрическим приводом), которые могут размещаться перед радиатором или позади него, способствуют процессу охлаждения. Особенно эффективно это происходит при медленном движении или стоящем на месте автомобиле. Для того, чтобы поддерживать температуру охлаждающей жидкости или двигателя на относительно постоянном уровне, потоком охлаждающей жидкости управляет термостат.

Современная система охлаждения: комплексные задачи

В последние годы современная система охлаждения стала значительно сложнее по своей разработке и технологиям. Причиной этого стали возросшие требования: системы охлаждения должны работать эффективнее и экономичнее, сюда добавляются более высокая нагружаемость, технология турбонаддува, автономные обогреватели и климатические установки, а также все более жесткие законы о выбросе ОГ. Здесь система охлаждения играет решающую роль, потому что только при соответствующей мощности охлаждения двигатель сможет устойчиво вырабатывать свой километраж. При этом детали от Behr Hella Service дают Вам важную уверенность в том, что эта мощность может быть оптимально использована.

Первое при техобслуживании и ремонте: высококачественные запчасти

Охлаждение двигателя является чувствительной системой, в которой все компоненты работают при высокой температуре и давлении как единая сыгранная команда. В новых автомобилях все модули стопроцентно подогнаны друг к другу и благодаря этому готовы развивать максимальную мощность. Этот уровень мощности и надежности может сохраняться при использовании высококачественных запчастей. Потому что только здесь соединяются технологическая компетентность, расчет мощности, точность посадки и качество материала.

НАШ АССОРТИМЕНТ В ОБЛАСТИ ОХЛАЖДЕНИЯ ДВИГАТЕЛЯ

Радиатор охлаждающей жидкости

Важнейшим компонентом системы охлаждения является радиатор охлаждающей жидкости. Он состоит из сердцевины радиатора и бачка радиатора со всеми необходимыми разъемами и элементами крепления. Тепло, образующееся в двигателе в результате сгорания топлива, поглощается охлаждающей жидкостью и выводится через радиатор в окружающий воздух. Радиаторы охлаждающей жидкости монтируются в передней части автомобиля в месте забора воздушного потока.

Интеркулер

Повышение мощности по всему диапазону частоты вращения, низкий расход топлива, улучшение КПД двигателя, снижение количества ОГ, термическая разгрузка двигателя – есть множество причин для охлаждения воздуха для сгорания топлива в двигателях с наддувом в радиаторах наддувочного воздуха.

Visco-муфта

Visco-муфта создает в зависимости от температуры силовое замыкание с рабочим колесом вентилятора и регулирует, тем самым, скорость его вращения. Там рабочий момент посредством неизнашиваемого жидкостного трения передается на рабочее колесо вентилятора. В visco-муфтах с электроприводом регулировка осуществляется напрямую через датчики. Охлаждение в зависимости от потребностей оптимизирует уровень температуры охлаждающей жидкости, шум двигателя и расход топлива.

Вентилятор

Для отвода тепла в мощных двигателях легковых автомобилей наряду с мощными радиаторами также необходимы вентиляторы и приводы вентиляторов, которые особенно эффективно подавали бы охлаждающий воздух. Вентиляторы состоят из крыльчатки и visco-муфты. Они используются в двигателях с продольным расположением и располагаются по направлению движения перед радиатором.

Теплообменник салона

Теплообменник салона находится в салоне автомобиля под приборной доской. Поток воздуха, создаваемый вентилятором салона, пропускается через теплообменник, по которому циркулирует охлаждающая жидкость. Нагретый при этом воздух затем попадает в салон автомобиля.

Расширительный бачок

Расширительный бачок предназначен для приема излишков расширяющейся охлаждающей жидкости из контура охлаждения.

Масляный радиатор

Масляный радиатор призван обеспечить почти неизменный температурный диапазон. Интервалы смены масла увеличиваются, и срок службы двигателя возрастает. Последняя модель от Behr - компактный и мощный масляный радиатор с демпфером. Поскольку у него отсутствует корпус, и он выполнен полностью из алюминия, он имеет малый вес и занимает мало места.

Вентилятор конденсатора/радиатора охлаждающей жидкости

Вентилятор конденсатора или радиатора охлаждающей жидкости состоит из электродвигателя с прифланцовой крыльчаткой вентилятора. Они располагаются перед или за конденсатором или радиатором. Посредством создаваемого потока воздуха он поглощает тепло из охлаждающей жидкости. В автомобилях с климатической установкой, как правило, используется дополнительный или более мощный вентилятор.

Водяные насосы

Водяной насос, как правило, имеет механический привод и перекачивает охлаждающую жидкость по контуру, а также нагнетает давление в системе. В большинстве случаев водяной насос соединяется с приводом ремнем.

Комплект водяных насосов

Наряду с отдельными водяными насосами (при необх. вкл. уплотнительные кольца круглого сечения или другие уплотнения) в продаже имеются удобные в монтаже комплекты водяных насосов, в которые включены зубчатые ремни, а также, если необходимо, натяжные, отводные и направляющие ролики, уплотнения и демпферы.
