Кислотные датчики для оптимального понижения уровня отработавших газов.

Законные предписания в области отработавших газов обязывают автомобильную промышленность к понижению эмиссии отработавших газов. По этой причине сегодня все автомобили с двигателями внутреннего сгорания оснащаются трехкомпонентным каталитическим нейтрализатором. Нейтрализатор преобразует вредные отработавшие газы в газы с безвредным воздействием на экологию. Для эффективной работы нейтрализатора необходимо четко согласовать соотношение топлива и воздуха. Кислородный датчик постоянно проверяет состав отработавших газов. Кислородный датчик находится в передней части системы отработавших газов перед нейтрализатором. Датчик измеряет содержание остаточного количества кислорода в отработавших газах. С помощью выходного сигнала

он регулирует систему управления двигателем, которая в свою очередь с помощью карбюратора производит четкую настройку топливоздушную смеси (см. рис. I). Данный, так называемый замкнутый контур регулирования обеспечивает оптимальное соотношение составных компонентов смеси. Благодаря этому одновременно обеспечивается оптимальный уровень преобразующего

действия нейтрализатора, а также оптимальная мощность двигателя. С помощью второго кислородного датчика, находящегося за нейтрализатором, осуществляется постоянный контроль безупречного функционирования нейтрализатора и датчика, расположенного перед ним. В случае погрешности на панели приборов немедленно появляется оптический сигнал.

Функция и техника

Существуют различные типы кислородных датчиков. Их различие заключается в керамических элементах, с помощью которых производится измерение составных частей отработавших газов. Датчики окиси циркония: внешняя сторона элемента окиси циркония находится в непосредственном контакте с отработавшими газами. Внутренняя сторона имеет контакт с воздухом. На обеих сторонах элемента нанесено тонкое платиновое покрытие. Ионы кислорода проходят через элемент и оставляют на платиновом покрытии электрический заряд. При этом платиновое покрытие представляет собой электроды; сигнал датчика передается дальше от элемента к соединительному проводу датчика (см. рис. II). При температуре 300°C элемент окиси циркония

достигает проводящую способность для ионов кислорода. Если на обеих сторонах элемента окиси циркония концентрация кислорода различна, то по причине особых свойств элемента образуется напряжение. При обедненном соотношении топлива и воздуха возникает невысокое напряжение. Если же данное соотношение насыщено, то напряжение высокое. Типичный скачок

напряжения происходит при соотношении топлива и воздуха приблизительно на уровне 1:14,7 (см. рис. III). Данное соотношение можно также охарактеризовать коэффициентом избытка воздуха ($\lambda = 1$ соответствует соотношению топлива и воздуха в размере 1:14,7; т.е. при этом происходит полное сгорание).

Рис. II

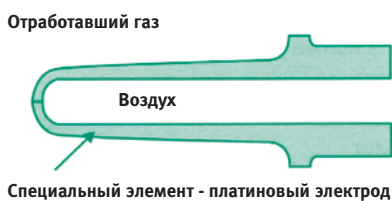

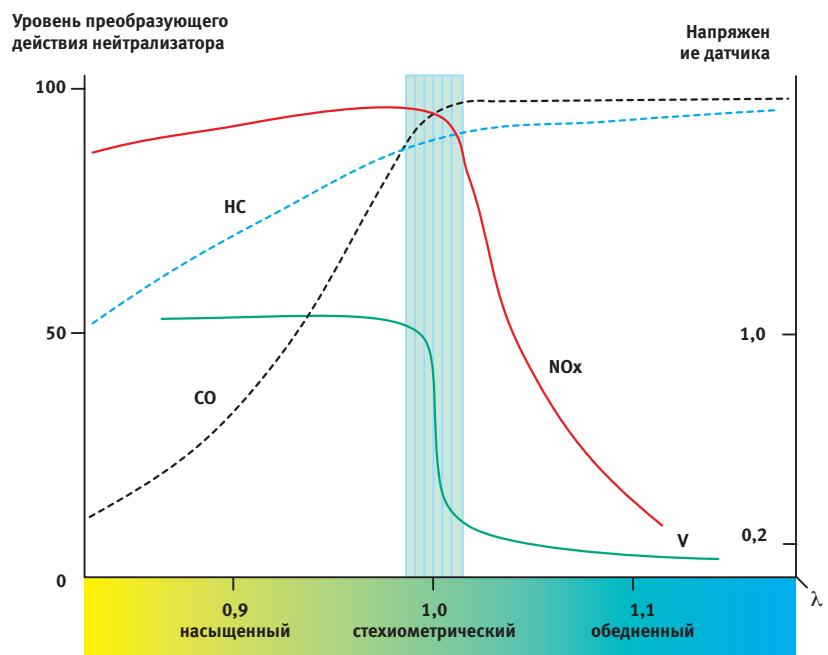

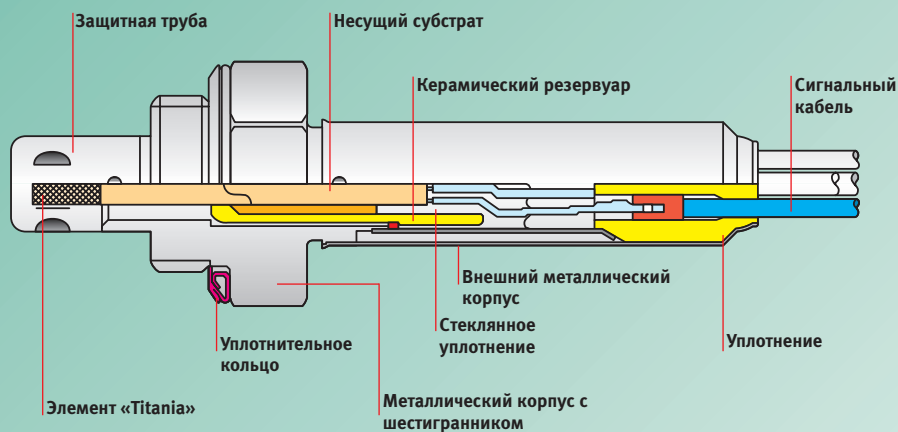

Рис. III

С помощью карбюратора либо электронного впрыскового механизма система управления двигателем регулирует соотношение топлива и воздуха. Необходимую для этого информацию система управления получает от кислородного датчика. Датчик создает напряжение только при достижении рабочей температуры свыше 300°C. По этой причине после старта двигателя элемент должен поработать определенное время для того, чтобы он нагрелся.

Сегодня почти все датчики оснащены внутренним керамическим нагревательным приспособлением, которое сокращает интервал времени до момента начала работы датчика. Датчики с нагревательными приспособлениями фирмы NTK являются примером многолетнего опыта в области толстопленочной и многослойной технологии. Благодаря им обеспечиваются высокое качество и надежность. Датчики окиси титана: элемент окиси титана не создает напряжение, как это происходит у элемента окиси циркония. Вместо этого производится изменение электрического сопротивления элемента окиси титана

в зависимости от концентрации кислорода в отработавших газах. При величине Лямбда 1,0 сопротивление сильно изменяется. При подаче напряжения к элементу изменяется выходное напряжение в соответствии с концентрацией кислорода в отработавших газах. Датчик окиси титана в отличие от датчика окиси циркония не нуждается в исходном воздухе по причине другой конструкции его функционального механизма. В связи с этим датчик окиси титана имеет небольшие габариты. Элемент датчика, его платиновые электроды и нагревательный элемент устанавливаются на базе толстопленочной и многослойной технологии фирмы NTK на керамическом субстрате. Датчики на

основе окиси титана нельзя заменить датчиками на основе окиси циркония, и, наоборот, по причине их различных габаритов и стратегических видов управления, которые используются для анализа сигналов от датчиков.

Испытание функционирования

Кислородные датчики, вышедшие из строя или с дефектами, обуславливают проблемы, как, например, высокий расход топлива, выход из строя и повреждение каталитического нейтрализатора, плохие динамические свойства или отрицательная оценка при прохождении теста отработавших газов. Испытание кислородных датчиков производится с помощью осциллоскопа. Перед выполнением испытания необходимо обеспечить условие, при котором двигатель должен быть настроен согласно данным производителя. После этого двигатель должен поработать определенное время, и достигнуть рабочей температуры, так как кислородный датчик функционирует только при правильной температуре.

С помощью соответствующего соединительного устройства выход датчика подключается к осциллоскопу. Датчик нельзя отсоединять от системы управления двигателем. Число оборотов двигателя должно находиться приблизительно на уровне 2.000 об./мин. В случае правильного функционирования кислородного датчика величина скачка напряжения находится приблизительно в диапазоне от 0,2 до 0,8 Вольт. Время, необходимое для повышения от 0,1 Вольт до 0,9 Вольт (время реакции «обедненное состояние - насыщенное состояние», должно составлять около 300 миллисекунд. Время реакции «обедненное состояние - насыщенное состояние» находится также в пределах этого диапазона. Если значение выхода датчика остается

постоянным или время реакции проходит медленно, то в данном случае замедленный датчик должен быть заменен.

Функционирование кислородного датчика необходимо проверять в рамках каждого технического осмотра и каждого контроля токсичности отработавших газов.

Медленно действующий датчик повышает расход топлива и в связи с этим такой датчик должен быть заменен.

Визуальный контроль

Для определения работоспособности кислородного датчика не достаточно выполнять визуальный контроль. Необходимо производить контроль соединительных линий и штекера, а также корпуса датчика, так как отклонения на этих участках обуславливают также искажение сигнала датчика. Повреждения на корпусе датчика говорят о механических ударах. Также состояние защитной трубы датчика может предоставить сведения о возможном неправильном функционировании.

Высокий уровень осаждения сажи приводит к закупорке датчика и отражается на времени реакции. Соотношение топлива и воздуха может быть чрезмерно насыщенным или же вышло из строя сенсорное нагревательное приспособление датчика. В любом случае такой датчик необходимо заменить.

Сажа

Высокий уровень осаждения белого или серого цвета указывает на использование присадок к топливу или на сгорание масла в двигателе. Определенные составные части в присадках к топливу и в масле загрязняют элемент датчика. Необходимо устранить причину загрязнения и заменить датчик.

Масло

Блестящие виды осаждения указывают на содержание свинца в топливе. Свинец производит разрушающее действие на платину, которая находится на элементе датчика и на каталитическом нейтрализаторе. При этом датчик должен быть заменен. После выполнения замены необходимо обратить внимание на то, чтобы использовалось исключительно только топливо без содержания свинца.

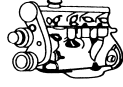

Свинец

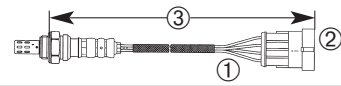

Кислородные датчики фирмы NTK Надежность благодаря качеству

Результат многолетнего опыта: фирма NTK является ведущим производителем кислородных датчиков в мире. Благодаря многолетнему опыту в области разработок и изготовления кислородных датчиков фирма NTK в состоянии предложить соответствующий датчик почти для каждого автомобиля. Все составные

части, типы элементов, нагревательные сопротивления и соединительные штекера соответствуют оригинальным запчастям производителей, и предоставляют возможность для удобной установки без всяких проблем.

HANDLING INSTRUCTIONS

- Read enclosed instructions before installation.
- Do not use sensor if it has been dropped.
- Do not store under high temperature and/or high humidity conditions.

INSTALLATION INSTRUCTIONS

- This sensor is designed for the use in automobiles only.
- Use the correct part number as listed in the application catalogue.
- Do not use sensor if it has been dropped.
- Remove protection cap just prior to installation.
- Firstly install sensor body ensuring lead wire is not twisted or bent.
- Do not use impact wrench or socket type wrench to install sensor.

- **M18 sensors** - install finger tight then 1/2 - 3/4 turn with a wrench (35 ~ 45 Nm).

- **M12 sensors** - install finger tight then 3/4 - 1 turn with a wrench (18 ~ 23 Nm).

- Then connect and route lead wire as originally installed.
- Do not allow lead wire to touch exhaust manifold or any other hot component.
- Do not expose this product to water, oil, windshield cleaner, anti-corrosion oil, grease, terminal cleaner etc.
- Do not use leaded fuels, silicone or metal based additives.
