AISIN

One Team, Best Future

GJ PARTS AND MORE, INC.

Introducing for Hydraul

Before

100% OE Quality You Can Trust.

Spring 2010: AISIN's precision honed brake products and SEI's OE quality brake pads became ADVICS brand products.

ADVICS is the premier brake systems supplier to car manufactures around the world.

Meet the AISIN Family

Offering a wide selection of quality products.

Brake Master Cylinder

Function

The brake master cylinder is a device that transforms mechanical force into hydraulic pressure. As the driver presses the brake pedal, the pedal lever applies force to the brake master cylinder which transmits hydraulic pressure to the rest of the brake system components such as the ABS unit, brake calipers and wheel cylinders.

Structure and Components

The brake master cylinder provides the necessary force to control the application of brake power, and consists of the body, pistons, cups, springs and reservoir tank.

On the front of the body, the primary cup creates hydraulic pressure when fluid is forced inside by the piston. On the back of the body, the secondary cup guides the piston and prevents fluid from leaking. In the center of the body, the pressure cup separates brake fluid from the primary and secondary chambers. When the brake pedal is pressed, the primary cup is blocked away by the piston from the oil spill port leading to the reservoir tank, pressure in the cylinder rises as the fluid is fed through the brake lines. The secondary cup functions similar to and in synchronization with the primary cups. When the brake pedal is released, the hydraulic pressure and the force of the return spring pulls back the piston to relieve fluid back into the reservoir.

Variations

GJ PARTS AND MORE, INC.

There are several variations (types) of brake master cylinders, which is determined by the structure, additional brake assist systems and vehicle application. Though brake master cylinders can be classified into 3 main groups, all types share the basic functions required for braking action such as the generation, retention, and release of hydraulic fluid pressure.

Without ABS

► Conventional + Conventional

With ABS

► Long (Conventional + Conventional)

► Center Valve + Conventional

With Additional Functions Such as VSC, etc.

► Center Valve + Center Valve

Installation Procedure

CAUTION!

Failure to follow recommended procedures may cause brake failure and injury. Always consult the manufacturer's vehicle specific service manual for reference.

1

Ensure that mounting areas of the master cylinder and the pipe joints are free of damage and debris.

Fluid leakage and improper hydraulic pressure may cause brake failure.

2

Do not allow dust, dirt, and debris to enter the master cylinder or reservoir tank.

Internal damage may occur, resulting in fluid leakage and improper hydraulic pressure.

3

Always use a new O-ring or gasket if required for installation. Ensure proper installation of the O-ring or gasket for proper sealing.

Fluid leakage and improper hydraulic pressure may cause brake failure.

4

Use grease on o-rings and gaskets before installation for proper sealing and installation.

Grease will help seal and install the brake master cylinder correctly to ensure proper hydraulic pressure.

CAUTION!

Failure to follow recommended procedures may cause brake failure and injury. Always consult the manufacturer's vehicle specific service manual for reference.

5

Handle with care. Brake master cylinders are precision manufactured. Do not drop or deform. Never use a damaged unit.

Optimal hydraulic pressure may not be achieved due to damaged internal parts, resulting in incorrect operation and injury.

6

Tighten bolts, nuts, and screws and utilize the proper tools as specified by the manufacturer's vehicle specific manual.

Damage of screws and threads may cause improper braking function.

7

Use new brake fluid that is specified by the manufacturer's vehicle specific manual. Bleed the air accordingly to release trapped air within the hydraulic system.

Optimal hydraulic pressure will not be achieved if correct brake fluid is not used and/or the system was not bled. Brake failure may occur causing damage and injury.

Brake Wheel Cylinder

Function

Vehicles Equipped with Drum Brake Systems

The wheel cylinder is a component that transforms hydraulic power to mechanical force to control the expansion of the shoes within the drum brake system.

Variations

Leading-Trailing Type

2-Leading and Dual 2-Leading Type

* The figures above show static state position of the brake cylinder(s).

Leading-Trailing Type

2 Leading Type

General Components (all wheel cylinders)

(1) Cylinder Body Material Variations:

Cast Iron

Highly durable and low cost.

Nickel-Phosphorous Plated Cast Iron

Same as Cast Iron type with excellent rust and wear resistance within the cylinder.

Hard Alumite Coated Aluminum Stock

Light weight characteristics with excellent rust and wear resistance.

(2) Aluminum Piston

Alumite coating achieves light weight characteristics with excellent rust and wear resistance. Press-fit steel support reinforces components attached to the shoe.

(3) Cup

Advanced technology EPDM material provides excellent sealing and heat resistance.

2-Leading Type

Wheel cylinder with auto-adjuster

The wheel cylinders for the 2-Leading type drum brake system are normally utilized on the front brakes for truck applications. One piston is used per cylinder assembly.

Adjuster bolt prevents excess piston stroke, resulting from the gradual wear of the friction material on the brake shoe.

Hydraulic section of the 2-Leading type is similar to the Leading-Trailing type.

For auto-adjuster function, refer to next page.

Variations

Dual 2-Leading Type

The wheel cylinders for Dual 2-Leading type drum brake system are normally utilized on the rear brakes for truck applications. A pair of pistons are used per cylinder assembly.

Wheel Cylinders with Auto-Adjusters

Auto-adjuster equipped wheel cylinders compensate for increased piston stroke due to wear from the friction material on the brake shoe.

Operation:

The fulcrum for the auto adjuster is located at (1) the center of the screw. The lever (2) rotates around the fulcrum which rotates the adjuster nut (3). The rotation of the adjuster nut pushes out the adjuster bolt (4), which compensates for the decreased thickness of the friction material on the shoe. The piston assembly moves with the adjuster systems so that the piston stroke essentially does not change.

Manual adjusters only have the adjuster nut (3) and the adjuster bolt (4) components. Manual adjustments to compensate for the increased piston strokes are done by rotating the adjuster bolt and nut.

Installation Procedure

CAUTION!

Failure to follow recommended procedures may cause brake failure and injury. Always consult the manufacturer's vehicle specific service manual for reference.

1

Handle with care. Clutch master cylinders are precision manufactured. Do not drop or deform. Never use a damaged unit.

Optimal hydraulic pressure may not be achieved due to damaged internal parts, resulting in incorrect operation and injury.

2

Ensure that the boot is installed correctly so that it protect the cylinder for water, dust, dirt, and debris.

If the boot is not installed correctly, foreign objects could enter the mechanical assembly, causing insufficient brake control.

Brake Booster

Function

Braking force is transmitted to the braking unit (caliper or drum) using a lever and hydraulic pressure. Due to the high forces required on the lever to dampen the speed of heavier vehicles, the brake booster is designed to assist in applying the required pressure. The brake booster is a servo unit which uses negative pressure generated by the engine to the brake master cylinder.

Structure and Components

As the driver steps on the brake pedal, atmospheric air is introduced in the variable pressure chamber, producing a pressure differential between the variable and the constant pressure chamber. The force generated by the pressure differential on the plate is transmitted to the push rod via the booster piston which pushes the piston of the brake master cylinder. When the pedal is depressed, all components return to its original positions through the return springs.

Dependent on the application and capacity, a single or tandem chamber design brake booster may be used.

Installation Procedure

CAUTION!

Failure to follow recommended procedures may cause brake failure and injury. Always consult the manufacturer's vehicle specific service manual for reference.

1

Confirm that the piston section is free of flaws, dents, fractures, etc.

Piston section

Flaws, dents, fractures

Insufficient pressure or leaks may occur if damaged.

2

Confirm that the body is free from cracks or fractures.

Cracks & Fractures

Insufficient pressure or leaks may occur if damaged.

3

Confirm that Seals No. 1 & 2 are free of flaws.

Flaws

Seal No. 1

Seal No. 2

Insufficient pressure or leaks may occur if damaged.

4

Confirm that the caulked area around the perimeter of the body are not deformed or dented.

Deformation & Dents

Insufficient pressure or leaks may occur if damaged.

Installation Procedure

CAUTION!

Failure to follow recommended procedures may cause brake failure and injury. Always consult the manufacturer's vehicle specific service manual for reference.

5

Do not hold or lift from the input rod.

Internal parts may be damaged and the brake booster may fail to operate correctly.

6

Handle with care. Do not drop or deform. Do not install if damaged.

Brake booster may fail to operate correctly.

7

Confirm that bolts are not deformed or damaged.

Brake booster may not mount properly causing failure to operate correctly.

8

Do not contaminate the brake booster with oil, grease, brake fluid, etc.

Contamination may cause the paint to peel, exposing bare metal to the elements.

CAUTION!

Failure to follow recommended procedures may cause brake failure and injury. Always consult the manufacturer's vehicle specific service manual for reference.

9

Take care to protect the inside of brake booster from ingress of water or foreign matters.

It could cause rust formation at the inside or damage seals so that the brake booster may fail to function properly.

CATALOG 2010/2011

IMPORTANT NOTICE

The purpose of this catalog is to furnish our customers with as complete a listing of their brake hydraulic parts requirements as possible.

All listings, applications or interchanges contained in this catalog are based on the latest information available at the time of printing. Every effort has been made to ensure that the information contained in this catalog is correct, but we do not assume any responsibility for errors which may occur.

All references to manufactures names or part numbers are only used as a guide when ordering brake hydraulic parts.
