VW Golf lll & Vento

DK

Forfjedrene på nogle Golf lll & Vento modeller blev modificeret fra produktions dato 08/94. Formålet var at øge stabiliteten ved lave hastigheder.
De ny modeller har et mindre fjederanlæg i toppen. Derfor er fjedre til de første modeller ikke udskiftelige med fjedre til de nyere modeller.

Ændringen blev foretaget med virkning fra følgende chassis numre:
- 1H SW 062538 & 1 H SB 019475 (08/94)

Hovedparten af de vogne der er udstyret med motorer, der yder mere end 85 kW. (112 hk), er som standard udstyret med "PLUS" undervogn.
Dog kan nogle 2.0 L med aut. være udstyret med begge typer. De væsentligste kendetegn for de 2 typer undervogn er følgende:
- BASIS undervogn: Monteret med 4 huls fælge
- PLUS undervogn: Monteret med 5 huls fælge

D

Die Vorderachsfedere am Golf lll & Vento wurden während der Produktionszeit des Fahrzeuges überarbeitet. Zeil dabei war ein verbessertes Lenkverhalten bei geringer Fahrgeschwindigkeit.

Das "Plus-Fahrwerk" wurde serienmässig in den folgenden Typen ab Werk eingebaut:
- 2.0 L - 8V / 2.0 L - 16V / VR6.

Bei anderen Typen war das "Plus-Fahrwerk" als Sonderausstattung erhältlich. Das „Plus-Fahrwerk" ist gegenüber dem "Basis-Fahrwerk" um ca. 20 mm. tiefergelegt.
Ab Produktionsdatum 09/94 wurden Federn mit einem kleineren Durchmesser am oberen Aufnahmepunkt eingesetzt. Diese Federn sind somit nicht kompatibel mit den herkömmlichen Federn. Als folge wurde der obere Durchmesser des Federtellers verkleinert. Die Zuordnung der Vorderachsfedern kann der gleitenden Einführung der technischen Änderungen nicht immer einwandfrei festgestellt werden.

Der Fahrwerk-Typ läßt sich jedoch bei geöffneter Motorhaube schnell feststellen:
- Basis-Fahrwerk: Der am Federdom sichtbare Fangtopf des Federbeines ist mit einer Plastikkappe abgedeckt. Die Vorderräder sind 4-Loch mit Kreisdurchmesser 100 mm.

- Plus-Fahrwerk: Der Fangtopf ist nicht abgedeckt und weist sternförmige Verstärkungssicken auf. Die Vorderräder sind 5-Loch mit Kreisdurchmesser 100 mm.

VW Golf lll & Vento

GB

The front coil springs on certain Golf lll & Vento models were revised at production date 08/94. Improved steering response at low speeds was the result of this revision.
These later vehicles use a smaller upper spring seat than earlier models. As a consequence, springs for earlier vehicles are not interchangeable for later vehicles.

The spring specification change occurred at the following chassis numbers:
- 1H SW 062538 & 1H SB 019475 (Production date 08/94)

The majority of Golf lll & Vento models that are fitted with engines with power rating 85 kW. (112 PS) or more, are equipped as standard with "Plus-Suspension". Some 2.0 L models which have automatic gearbox may, however, be fitted with either suspention type. The information below will assist in identifying which suspension is fitted to the vehicle in question.

The type of suspension fitted to vehicle can easily be determined by opening the bonnet:
- Basic-Suspension: The front suspension strut insulator, where it locates at the suspension turret, is by a, plastic cap. The front wheels have four holes with PCD = 100 mm.

- Plus-Suspension: There is no plastic cap and the insulator has reinforcing ribs. The front wheels have five holes, with PCD = 100 mm.

SPIRALFJEDRE & FRIHØJDE / KØREHØJDE

De fleste biler er i dag monteret med spiralfjedre. I midten af halvtredsrene blev det almindeligt at bruge spiralfjedre, da det uafhængige forhjulsophæng blev populært, og det er siden blevet normalt at bruge spiralfjedre til alle fire ophæng.

Spiralfjedre er lettere, nemmere at fremstille, mindre og billigere end bladfjedre, og har en højere ydeevne i forhold til vægt og størrelse.
Alligevel vil spiralfjedre efter millioner af sammenpresninger forringes og miste ydeevne, således at køretøjets frihøjde bliver mindre. Der er flere grunde hertil. :

1. Rust vil reducere smidigheden og derved svække fjederen.

2. De mange sammenpresninger vil trætte og deformere stålet, således at fjedrene ikke retter sig til den oprindelige længde.

3. Mekanisk skade, som regel stenslag, som beskadiger overfladebehandlingen, kan forårsage, at fjederen knækker. P. g. a. den moderne konstruktion af fjedre med høj ydeevne vil fjedrene svækkes/knække, når overfladen beskadiges, og der opstår "stress" punkter.

   Fjedrene knækker som regel i nærheden af den sidste vinding, p. g. a. den maksimale belastning netop disse steder. Nogle konstruktioner er specielt udsatte for skader, som f. eks. Opel Kadett C, Ascona og Manta B, alle både for og bag og Ford Taunus foran. Disse fjedre anlægger en mindre bue, når de er monteret.

For at bedømme ydeevnen af fjedrene på bilen, skal to ting konstateres :

1. Er fjedren knækket ?

2. Er fjedren deform, eller "hænger" den ?

Den bedste måde at besvare spørgsmålene på er :

1. Visuel inspektion - Se om fjedren er knækket

2. Ved udmåling - Mål frihøjden på bilen og sammenlign med frihøjden iflg. fabrikkens specifikationer.

Selvom det ikke er muligt at udstikke faste retningslinier, vil enhver bil, der "hænger" mere end 25 - 50 mm., være "moden" til nye fjedre. Kontroller samtidig støddæmpere. En bil med nye fjedre og støddæmpere vil af kunden opleves som NY.

CHECK LISTE

1. Er fjedren knækket ? Se specielt på top og bund. Fjedre knækker som oftest nær enderne.

2. Er fjedren rusten ? En rusten fjeder er ofte "svag".

3. Med bilen på plan grund eller på fire-søjlet lift, mål frihøjden og sammenlign med fabrikkens specifikationer. Såfremt differencen er mere end 40 mm., bør fjedrene skiftes.

4. Bilen må ikke "hænge", hverken set fra siden eller forfra/bagfra.

COIL SPRINGS & RIDE HEIGHTS (1/2)

The majority of motor cars in current production use coil springs as their suspension medium. The coil spring took over from the leaf spring after the Second World War when independent front suspension became popular, and has since become the normal fitting to all four corners of a modern car.

The coil spring is lighter, easier to make, smaller and cheaper than a leaf spring and is capable of high performance in relation to its weight and size. However, although a well designed coil spring will compress and return to its original lenght many times, its performance does over many millions of cycles, deteriorate and the ride height of the vehicle begins to come down. There are several reasons for this. :

1. Rust will reduce the cross sectional area of the steel and so weaken it.

2. Many cycles of compression will cause the steel to fatigue and deform so that it does not return to its original height.

3. Mechanical damage, usually caused by stone chips or damage to the protective paint finish during fitting, will cause it to break. The modern designs of highly stressed springs will break if the surface is damaged and a stress raiser is formed.

The spring usually breaks near the last coil, this being the point of maximum stress of the spring and breakage can often be observed by the eye before the effect can be felt by the driver. Some designs of springs are especially prone to breakage, e. g. rear wheel drive Vauxhall Chevette and Cavalier both front and back, and Ford Cortina front. These springs are curved when fitted.

<u>To measure the performance of the spring on the vehicle there are two questions to be answered :</u>

1. Is the spring broken ?

2. Has the spring deformed or sagged ?

<u>The best way of answering the questions is :</u>

1. By eye - look to see if the spring is broken. This is an MOT failure and potentially dangerous.

2. By measurement - measure the ride height of the vehicle and compare this with the ride height when new

Although it is not possible to issue hard and fast rules, any vehicle that has sagged more than 1" - 2" would benefit from new springs, and the opportunity of replacing what may well be worn out dampers should be taken as well. A vehicle fitted with new springs and dampers will be transformed and the owner will have a vehicle whose ride and handling has been returned to "as new".

To measure the ride height the most important dimension is "wheel centre to wheel arch". This discounts changes in tyre pressure, between different wheels, or different models in the same range. To take this measurement the only equipment required is a tape measure and a piece of level ground.

Drive the car onto level ground, remove any particularly heavy luggage and all passengers, and measure the distance from the centre of the wheel, or knove plate, to the lip of the wheel arch directly above it.

The measurement gives you an acceptably accurate guide to the ride height of the vehicle and can be used to make comparison with the vehicle when new.

The "Vehicle Ride Height Data" table is compiled from a survey of vehicles and manufacturers data. It is important to note that certain models vary considerably from car to car, and variations of up to 1" between two supposedly identical new vehicle is not unknown

COIL SPRINGS & RIDE HEIGHTS (2/2)

MECHANICS CHECK LIST
VISUAL INSPECTION

1. Is the spring broken? Look at the top and bottom coils. Springs usually break near the ends.
2. Is the spring very rusty? A rusty spring may be weak and could break.
3. With the car on level ground or on a four post lift, measure the distance from the centre of the wheel to the wheel arch.
4. Compare this measurement with that in the table for a new car. If the difference is over 40 mm. (i. e. 1½"), new springs should be fitted.
5. If the car, when viewed from the front or rear, is down at one side, check heights against the table.
6. If the car, when viewed from the side, is down at either front or back, or the trim line does not appear level, check both front and rear heights against the table.

SPIRALFEDER UND KAROSSERIE FAHRHÖHE (1/2)

Heutzutage werden die meisten Fahrzeuge mit Spiralfedern produziert. Nachdem das unabhängige vordere Spiralfedersystem bekannt wurde, hat die Spiralfeder den Platz der Blattfeder mitte der fünfzigerJahre übernommen und wird seitdem an modernen Fahrzeugen an allen vier Aufnahmpunkten montiert.

Die Spiralfeder ist leichter, einfacher herzustellen, kleiner und preisgünstiger als die Blattfeder und hat eine höhere Leistungsfähigkeit im Verhältnis zu Grösse und Gewicht. Obwohl die Spiralfeder so konstruiert wurde, daß sie nach höufigen Zusammenpressen wieder zur normalen Länge springt, ist es nicht zu vermieden, daß nach einer längeren Periode sich die Spiralfeder verschlechtert und die Höhe des Fahrzeuges sich dadurch verringert. Mehere Gründe treffen dafür zu :

1. Rost reduziert die Dichtigkeit im Stahl und Schwäche tritt auf.

2. Nach einer gewissen Periode, durch ständiges Zusammendrücken der Spiralfeder, verschlechtert und verformt sich der Stahl und die Spiralfeder kann somit nicht mehr zur originalen Länge zurückspringen.

3. Mechanische Fehler können Gründe des Brechens der Spiralfeder sein. Angeschlagene Stellen verursacht durch Steine oder durch Beschädigung der Schutzfarbe während der Montage. Die moderne Konstruktion von einer sehr beanspruchten Spiralfeder wird brechen, wenn die Oberfläche der Spiralfeder beschädigt ist und dadurch eine zu höhe Spannung an gewissen Punkten auftritt.

Die Spiralfeder bricht meisten´s nähe der letzten Spirale, da dies der Punkt mit der höchsten Spannung auf der Spiralfeder ist. Fehler an der Spiralfeder sind oftmals im vorraus sichtbar, bevor der Fahrer den Unterschied beim Fahren bemerkt. Einige Spiralfederkonstruktionen neigen besonders zum Brechen, wie zum Beispiel : Opel Kadett C bzw. Vauxhall Chevette und Ascona B und Manta B beides vorne und hinten auch Ford Taunus vorne. Diese Spiralfedern sind gebogen, wenn sie montiert werden.

Zwei Fragen sind zu beantworten, um die Leistung der Spiralfederdes Fahrzeuges zu überprüfen :

1. Ist die Spiralfeder gebrochen ?

2. Hat sich die Spiralfeder verformt oder ist sie gesackt ?

Die Fragen werden am Besten wie folgt beantwortet :

1. Per Auge - Sehen Sie nach ob die Spiralfeder gebrochen ist. Beim TÜV ist dieses ein Durchfallpunkt und wird als gefährlich angesehen.

2. Per Messung - Messen Sie die Höhe des Fahrzeuges und vergleichen Sie die Angaben mit den ursprünglichen Maßen.

Obgleich es nicht möglich ist harte und strikte Regeln festzulegen, daß Fahrzeuge die mehr als 25 - 50 mm. gesackt sind, von neuen Spiralfedern profitieren sollte man die Gelegenheit nutzen eventuell abgenutzte Stossdämpfer zu ersetzen. Fahrzeuge mit neuen Spiralfedern und Stossdämpfern sind wie umgewandelt und der Eigentümer wird ein Fahrzeug erhalten, wo das Fahren des Fahrzeuges wieder "wie neu" sein wird.

Das wichtigste Maß, um die Fahrhöhe des Fahrzeuges zu messen ist vom "Mittelpunkt des Wagenrades zur unteren Kante des Radlaufes bzw. Unterkannte des Kotflügels". Damit werden Unterschiede in Reifengröße, Druck auf verschiedenen Reifen oder Unterschiede zwischen verschiedenen Reifenmodellen abgezogen. Um Maß zu nehmen werden nur ein Bandmaß und ein Stück ebener Boden benötigt.

Parken Sie das Fahrzeug auf ebenem Boden, entladen Sie das Fahrzeug von schweren Gegenständen wie Gepäck oder Beifahrer und messen Sie den Abstand vom Mittelpunkt des Wagenrades gerade hoch zur unteren Kante des Radlaufes bzw. Unterkante des Kotflügels.

Dieses Maß gibt Ihnen eine allgemeine Richtlinie über die Höhe Ihres Fahrzeuges und kann mit den Angaben des Fahrzeuges, als es neu war, verglichen werden.

Die "Fahrzeug Fahrhöhen" Tabelle wurde nach Angaben von Herstellern und Umfragen über verschiedene Fahrzeuge zusammengestellt. Es ist wichtig zu beachten, daß Fahrzeugmodelle von Wagen zu Wagen differieren können und ein Unterschied in Höhe bis zu 25 mm. zwischen zwei sogenannten identischen Fahrzeugen nicht ausgeschlossen werden kann.

SPIRALFEDER UND KAROSSERIE FAHRHÖHE (2/2)

MECHANIKER KONTROLLISTE
SICHTKONTROLLE

1. Ist die Spiralfeder gebrochen ? Untersuchen Sie die obere und untere Spirale. Spiralfedern brechen meistens am unteren Ende der Spirale.

2. Ist die Spiralfeder sehr rostig ? Rostige Spiralfedern sind schwach und brechen leicht.

3. Mit dem Fahrzeug auf ebenem Boden oder auf der Hebebühne messen Sie den Abstand vom Wagenradmittelpunkt zur unteren Kante des Radlaufes bzw. Unterkante des Kotflügels.

4. Vergleichen Sie die Angaben mit den Angaben in der Tabelle für neue Fahrzeuge. Neue Spiralfedern müssen montiert werden, wenn der Unterschied mehr als 40 mm. sein sollte.

5. Besichtigen Sie das Fahrzeug von vorne und hinten und sollte der Wagen auf einer Seite niedriger sein als auf der anderen, überprüfen Sie die Höhe mit den Angaben in der Tabelle.

6. Sollte die Vorder - oder Hinterseite niedriger sein überprüfen Sie die Höhe mit den Angaben für die Vorder - und Hinterseite in der Tabelle.

Obwohl wir uns bemüht haben, sicherzustellen, daß die Angaben in diesem Handbuch korrekt sind, übernimmt die Firma jedoch keine Verantwortung für falsche Beschreibungen oder Fehler darin und es wird keine Haftung für Beschädigung oder Verlust (ob indirekt, direkt oder folgerecht), die durch diese Angaben entstanden sein sollten, übernommen.
