PARTS LIST (P.C. BOARD AND ACCESSORIES)	15

WARNING:

Parts marked with  are of importance in respect to the safety use the specified type without tail.

FEATURES

1. The use of a low mass straight arm

This arm is capable of maximizing the performance of high compliance cartridges with superb tracing ability. Even with the newest high-grade records, its tracing ability is outstanding.

2. Newly developed "Tonearm Float" mechanism

This mechanism "floats" the tonearm from the cabinet to protect it from vibrations, which makes it possible to reduce unwanted noises caused by howling.

3. Electronically controlled contact-less servo tonearm

With the use of a micro processor to control the electronically controlled contact-less servo tonearm, safe and easy automatic operation is possible, with little loss of sound quality.

4. Newly developed linear drive MF motor

The "Magne-Float" mechanism uses the attraction of the magnets and the stater yoke to reduce the load of the turntable and the rotor on the pivot. This reduces pivot wear, allowing the turntable to operate smoothly for a long period of time.

5. Bi-directional servo with DENON quartz

Speed accuracy is unequaled with a bi-directional servo and a combination of a magnetic pulse detector and a quartz lock.

6. Electronic damping method (Q-damping)

Low frequency resonance, caused by cartridge compliance and the tonearm mass is electronically damped, while effectively checking the effects of crosstalk and the increase of irregular distortion. (DP-32F)

SPECIFICATIONS

- Phono motor section

Drive system	Servo controlled direct drive
Speeds	33-1/3 and 45 rpm
Wow flutter	0.012% WRMS or below (servo system) 0.02% WRMS or below (JIS)
S/N ratio	More than 78dB (DIN-B)
Rise time	Within 2 seconds (at 33-1/3 rpm)
Platter	Aluminum die-cast, 300mm diameter
Motor	MF (Magne-Float) Motor
Speed control method	Phase and speed servo with frequency detection
Load characteristics	0% (at outmost groove, 80g stylus force)
Brake	Electronic brake
Revolution speed deviation	Less than 0.002%

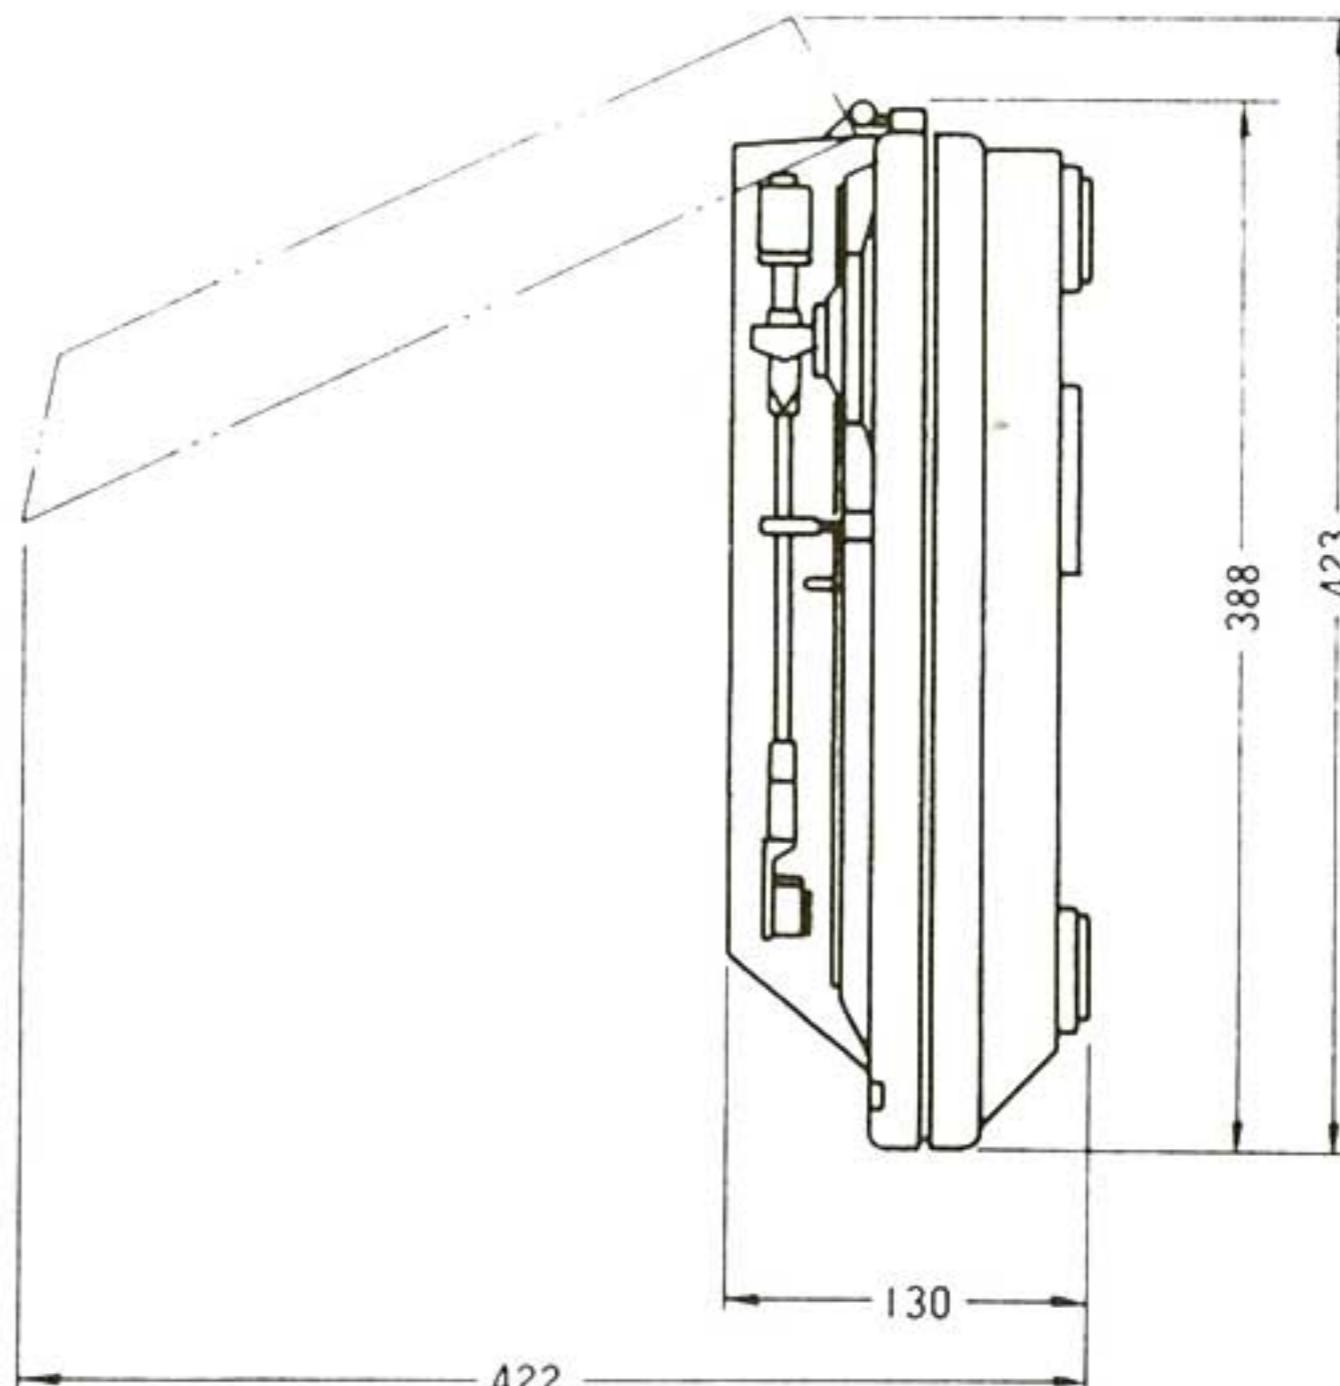

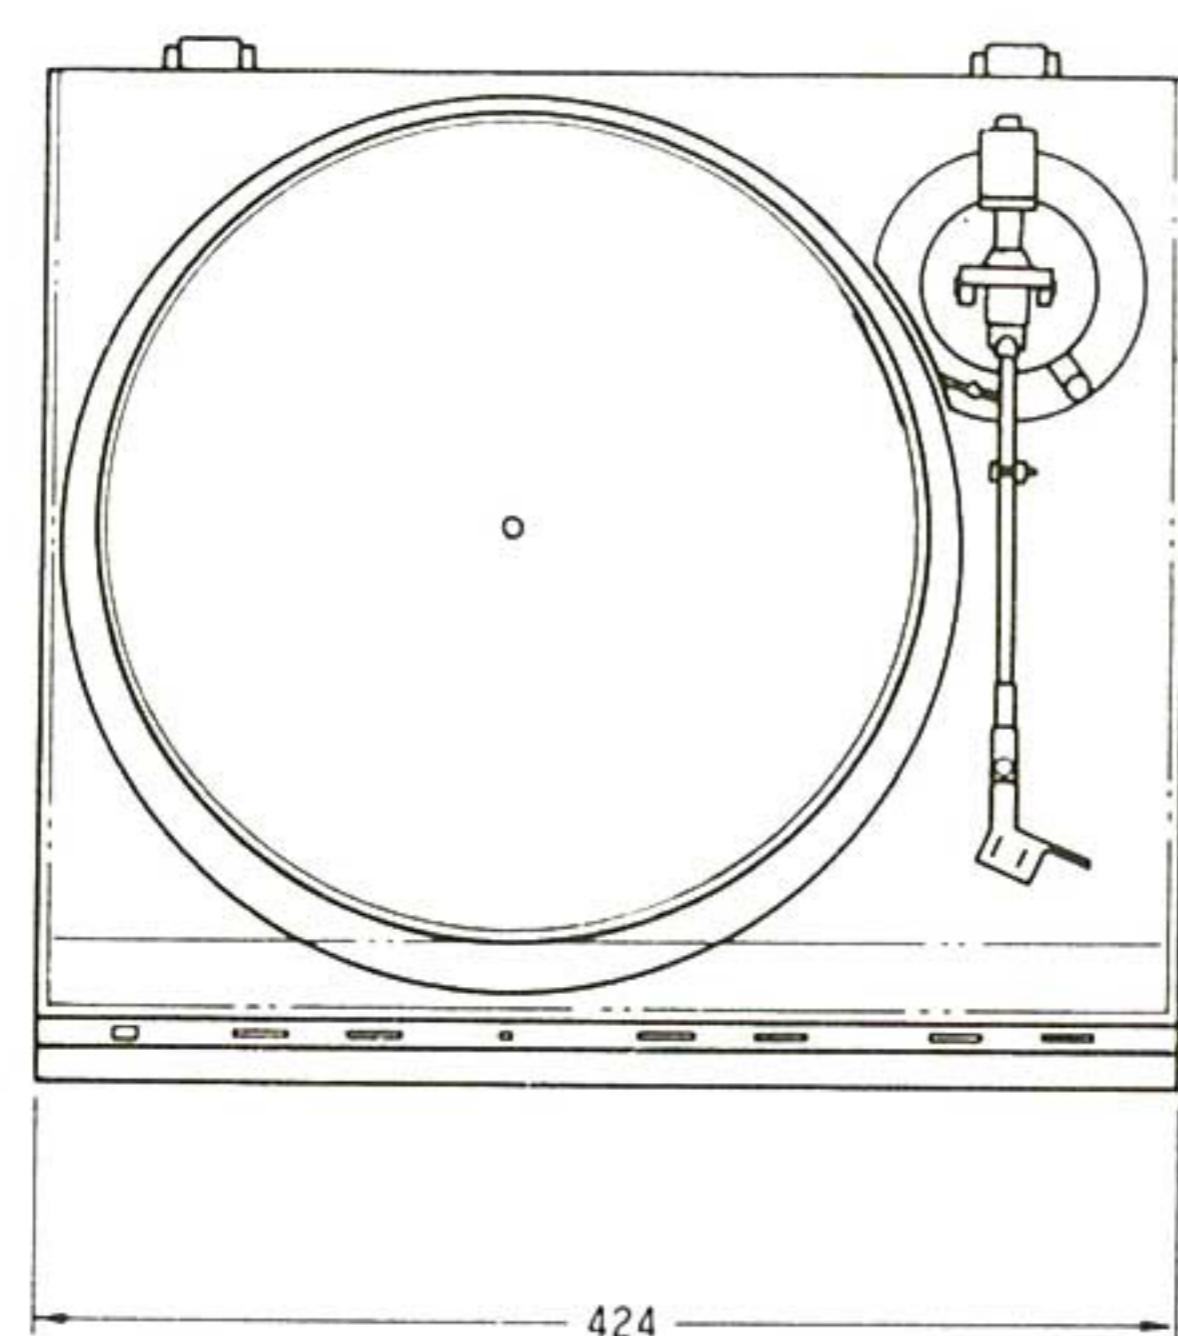

- Tonearm section

Arm type	Straight pipe, static balanced
Effective length	220mm
Overhang	16mm
Tracking error	Within 3°
Automatic mechanism	Fully automatic, electronically controlled
Adjustable stylus force range	0-2.5g per revolution (1 scale = 0.1g)
Suitable cartridge weight	Approx. 4-9g. (including screws, nuts)
Headshell	Specially hardened resin exclusive headshell
Anti-skating	Electronic
Q-damping	Electronic (DP-32F)

- General

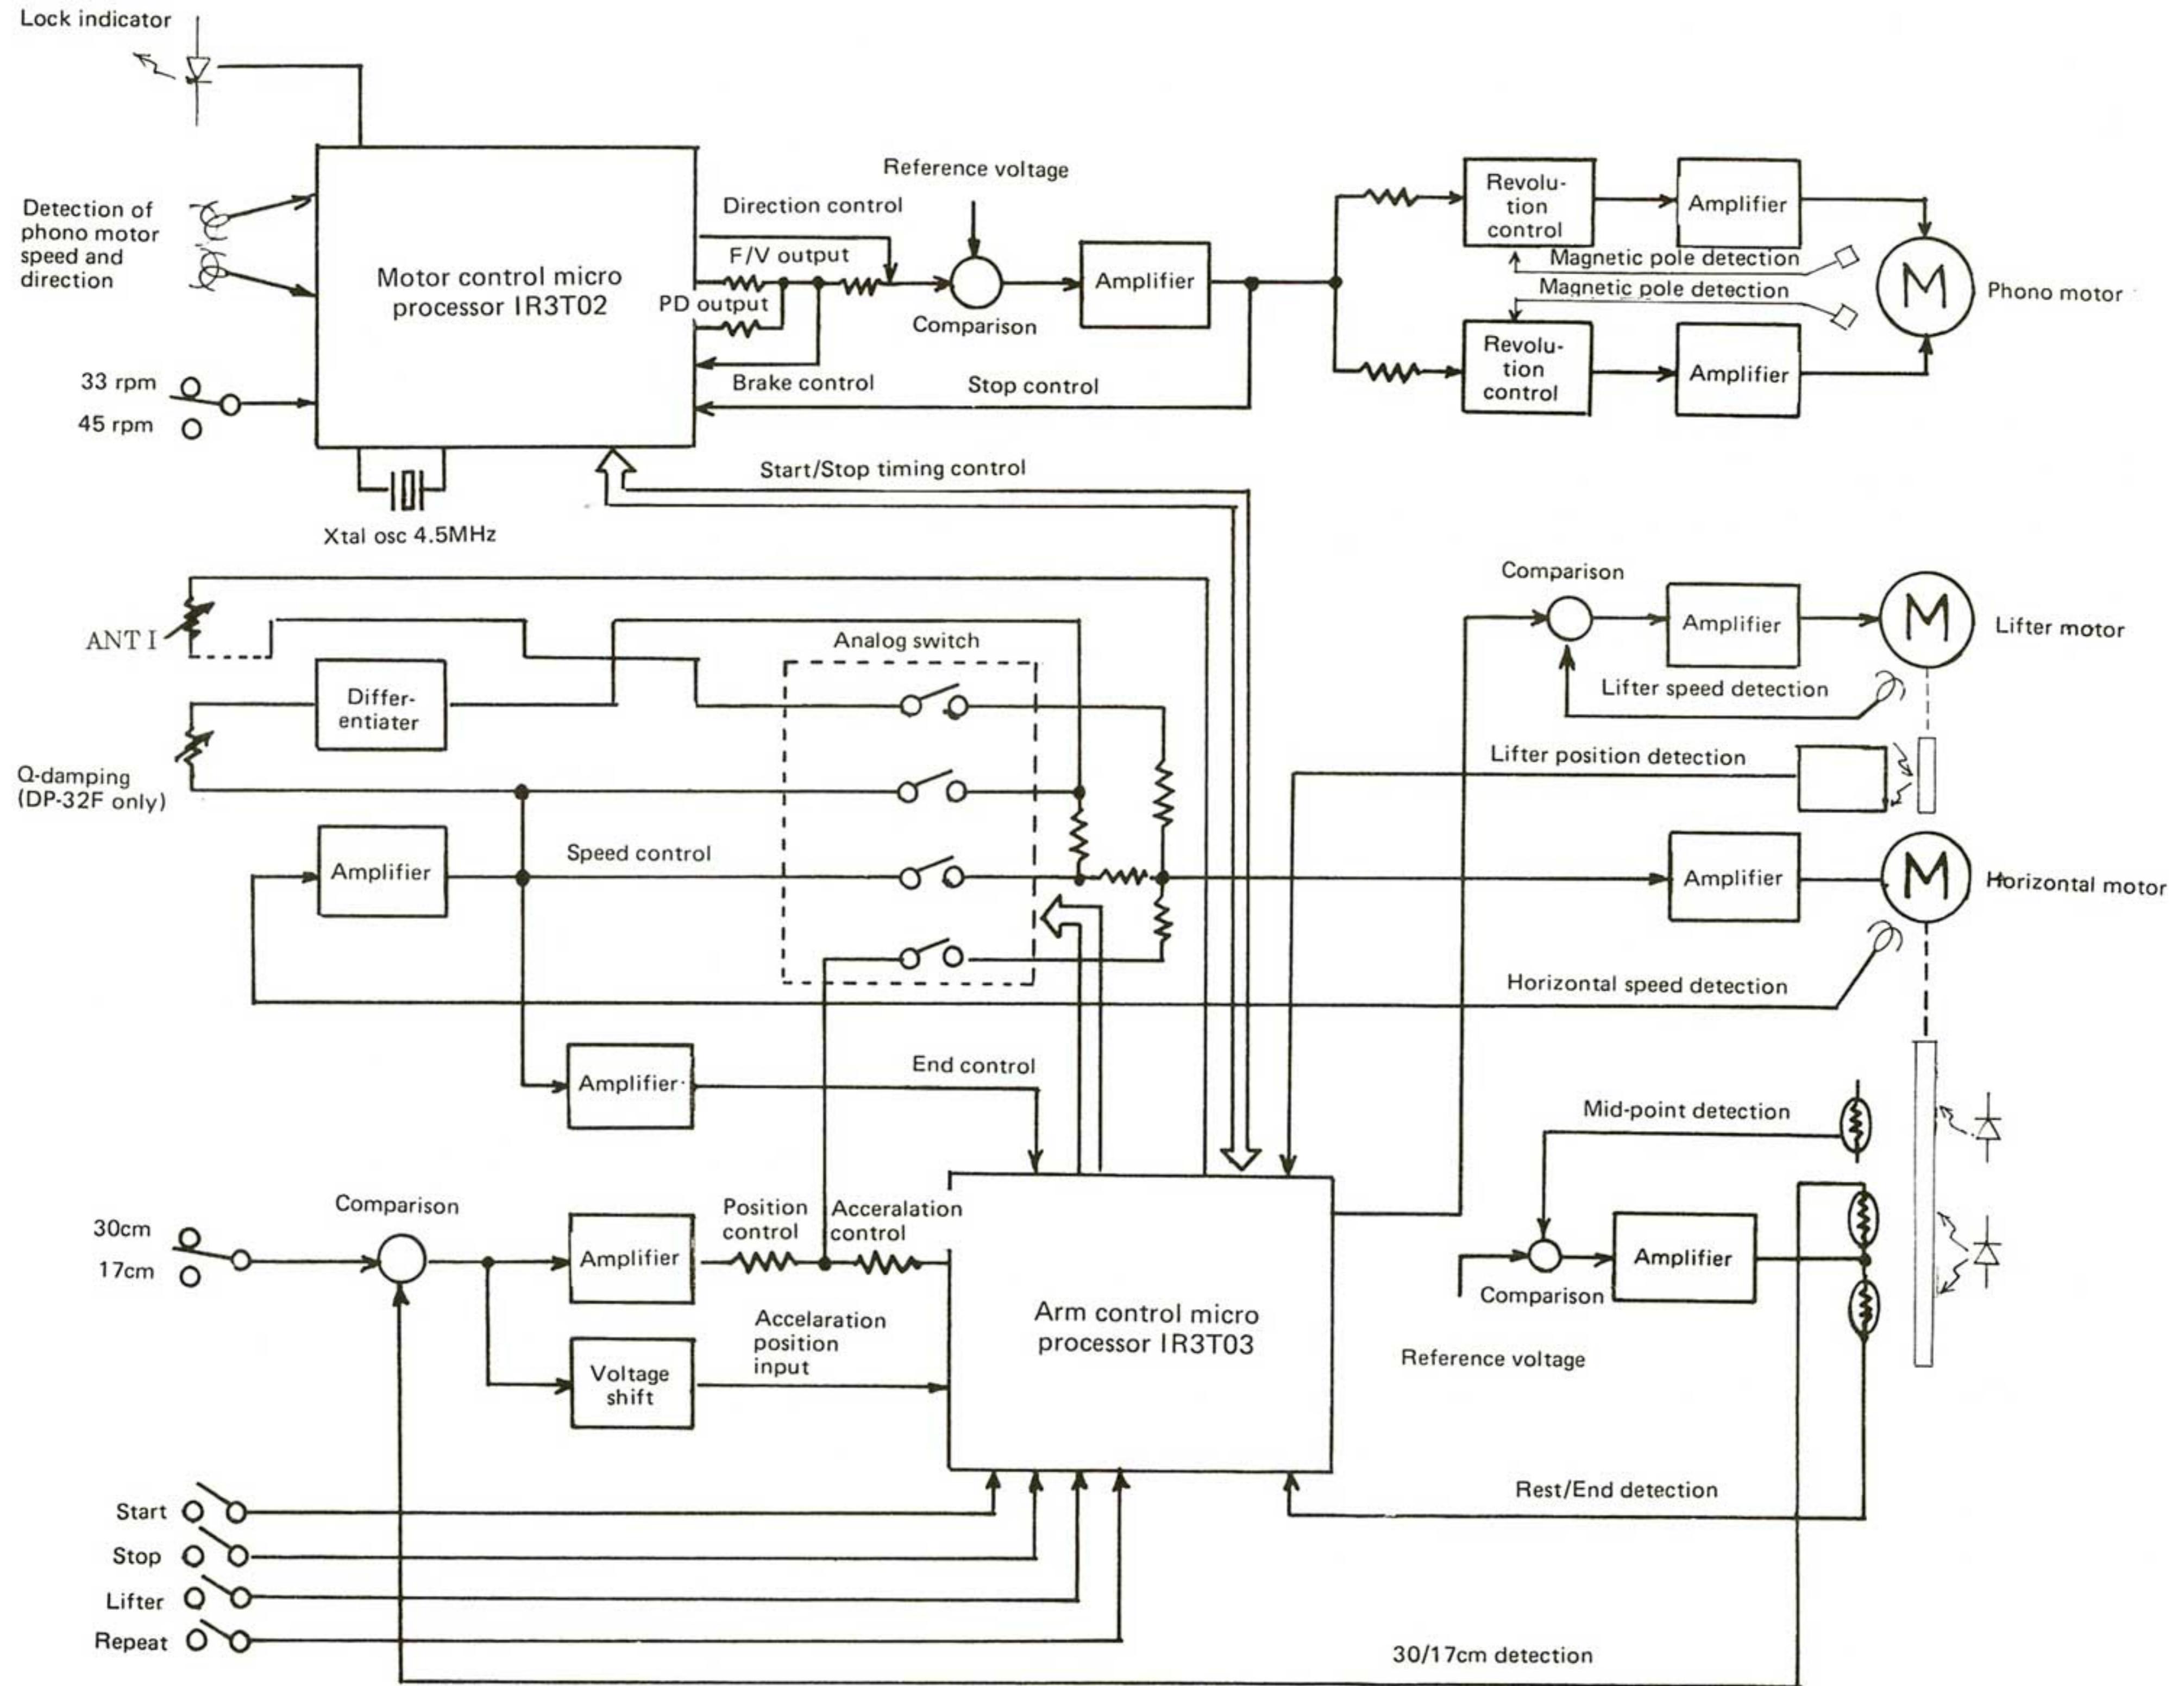

Power supply	50Hz/60Hz, Voltage is shown on rating label at the back of cabinet.
Power consumption	6W
Dimensions	130 x 424 x 388mm (H x W x D)

*The specifications and design are subject to change due to product improvement.

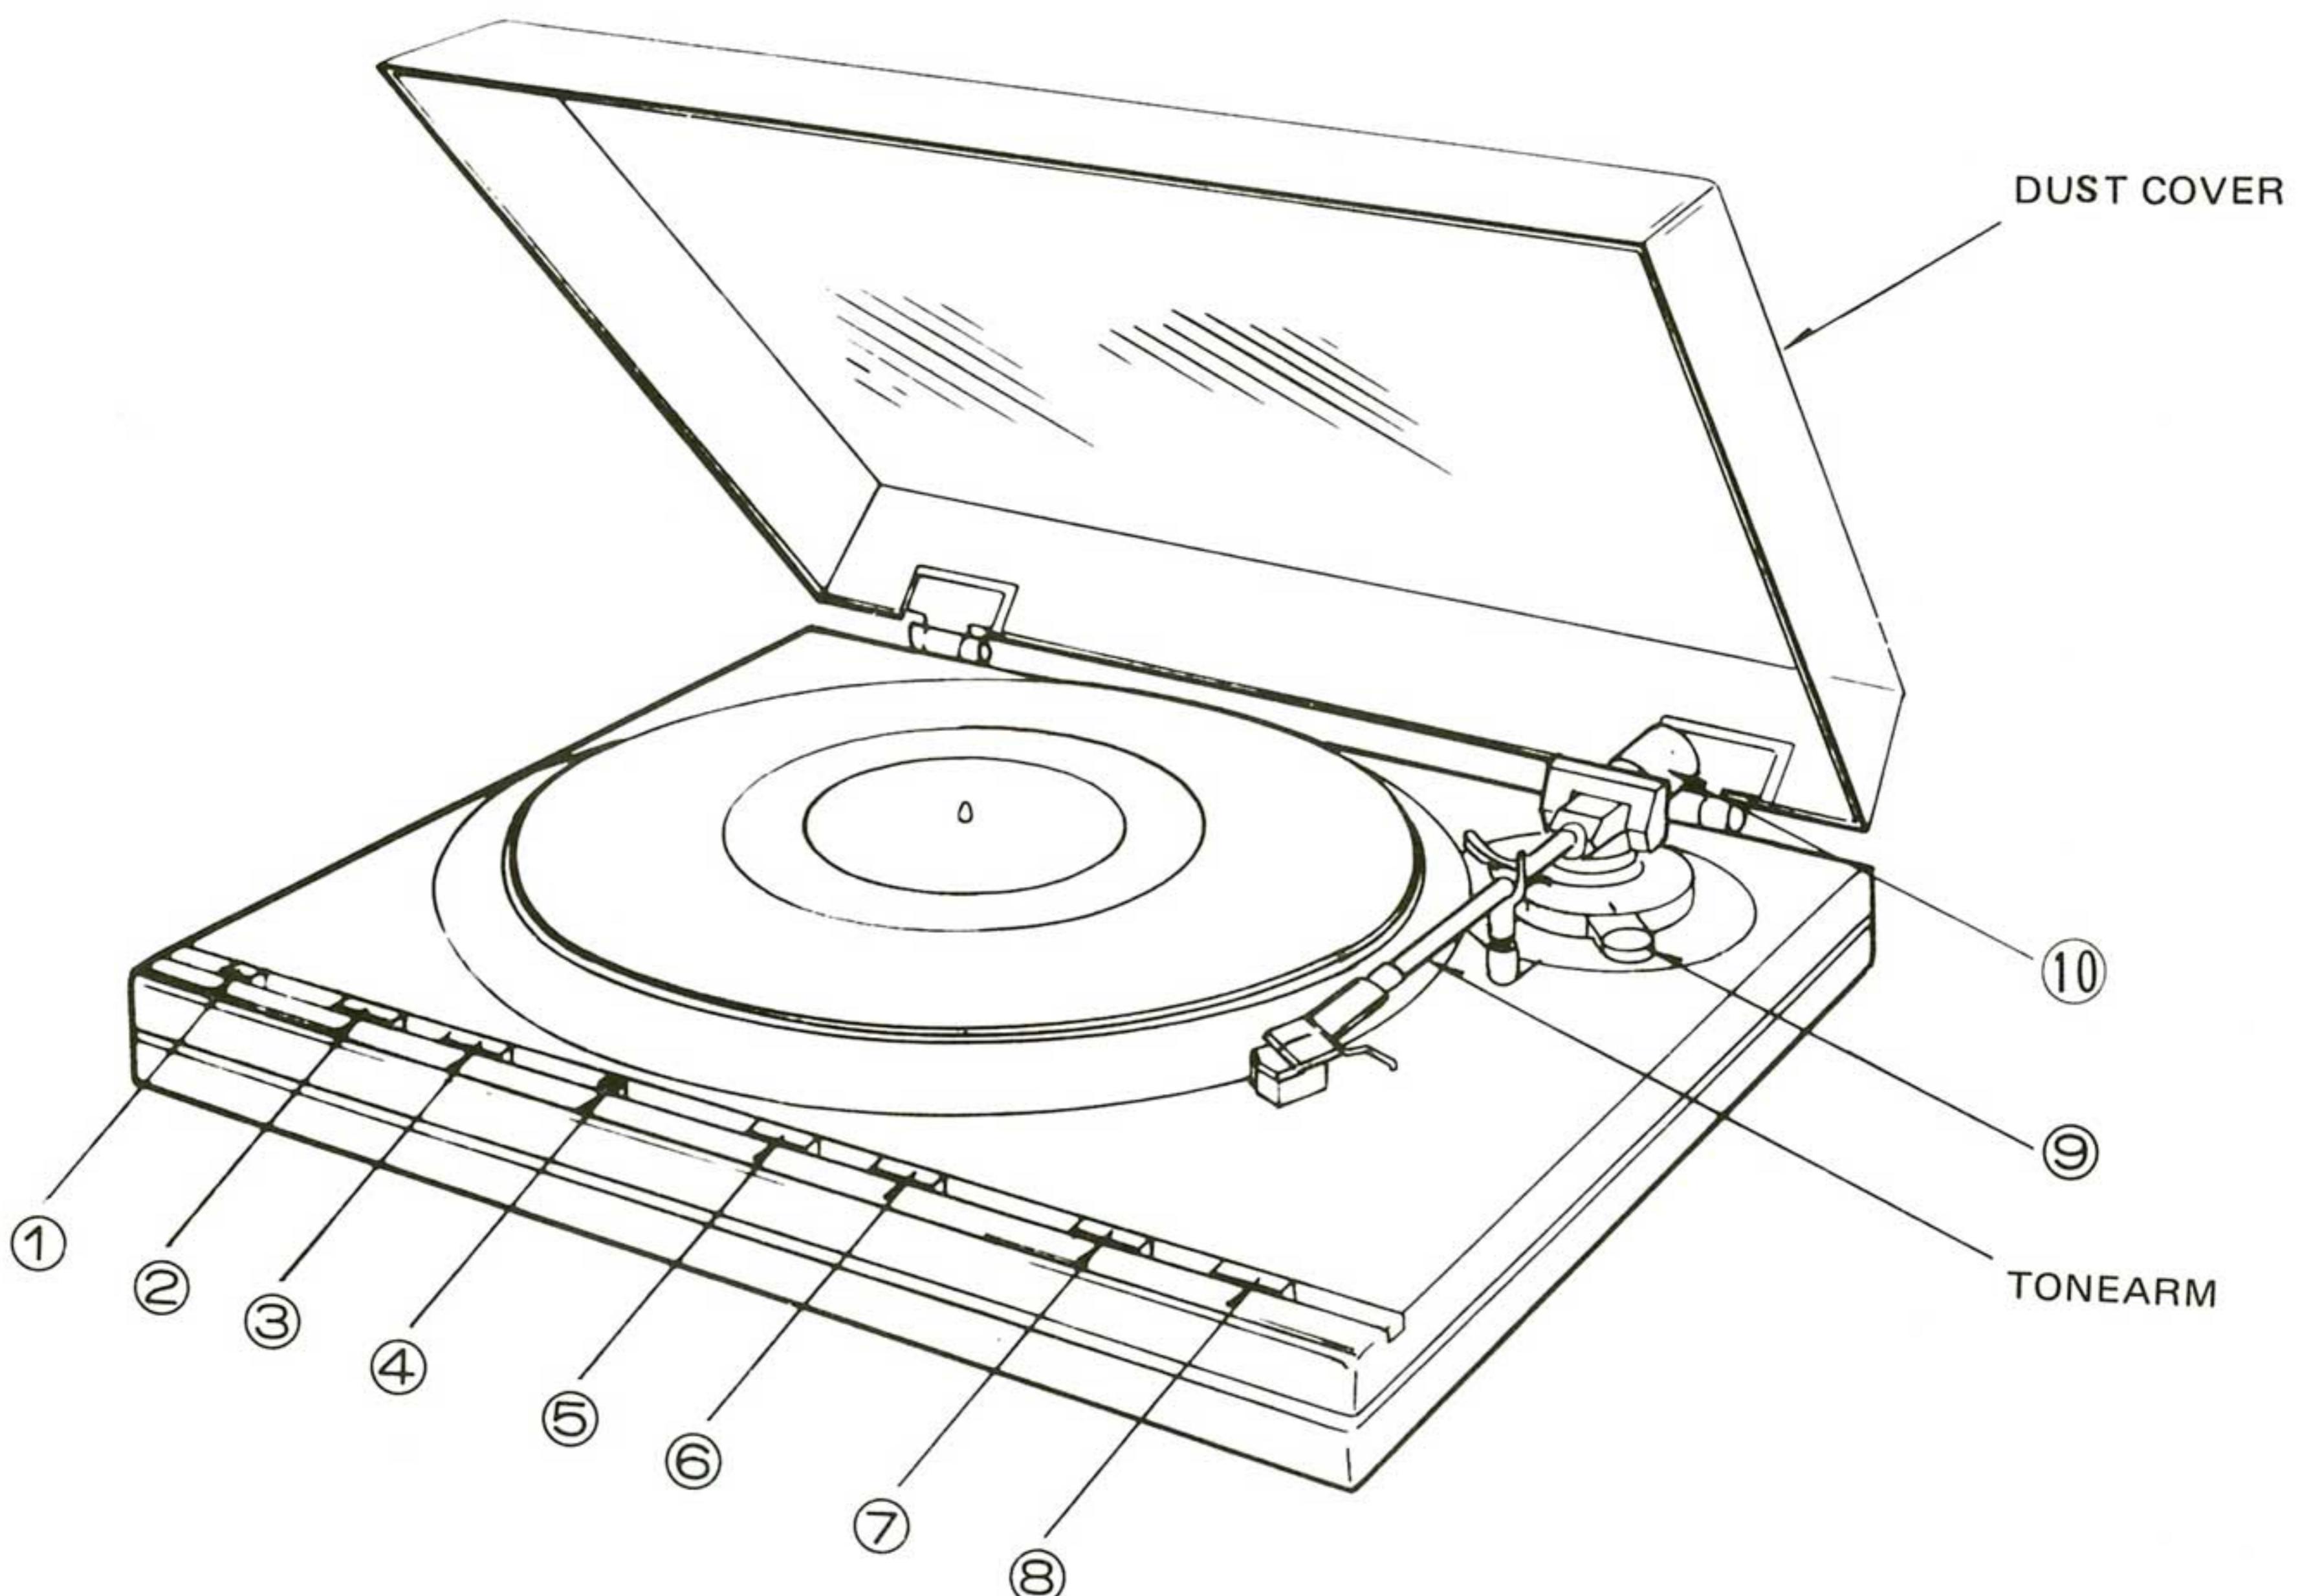

Outer dimensions (mm)

BLOCK DIAGRAM

PART NAMES AND FUNCTION

① Power switch "POWER"

The power will be turned ON (▲) or OFF (■).

② Record size selector "SIZE"

Set, according to the size of record to be played.

- | | |
|------------------------|----------|
| 30cm records | [30] (▲) |
| 17cm records | [17] (■) |

③ Speed selector "SPEED"

Set, according to the desired record speed.

- | | |
|-------------------------------|----------|
| 33-1/3 record speed | [33] (▲) |
| 45 record speed | [45] (■) |

④ Lock indicator "LOCK"

When the power source is on, the lamp will light up. During play, the light will flash until the turntable reaches normal speed. When the normal speed is obtained, the lamp will again light up continuously.

⑤ Repeat switch "REPEAT"

When repeated playing is desired, switch to the "ON" position. (■)

⑥ Arm lifter switch "ARM LIFTER"

This is used when manually lowering and lifting the tonearm from the record.

⑦ Start switch "START"

When playing records automatically, press this switch to start.

⑧ Stop switch "STOP"

When stopping the record, press this switch.

⑨ Anti-skating knob

Use this knob to adjust the anti-skating. With the DP-32F, Q damping will be adjusted automatically.

⑩ Counter weight

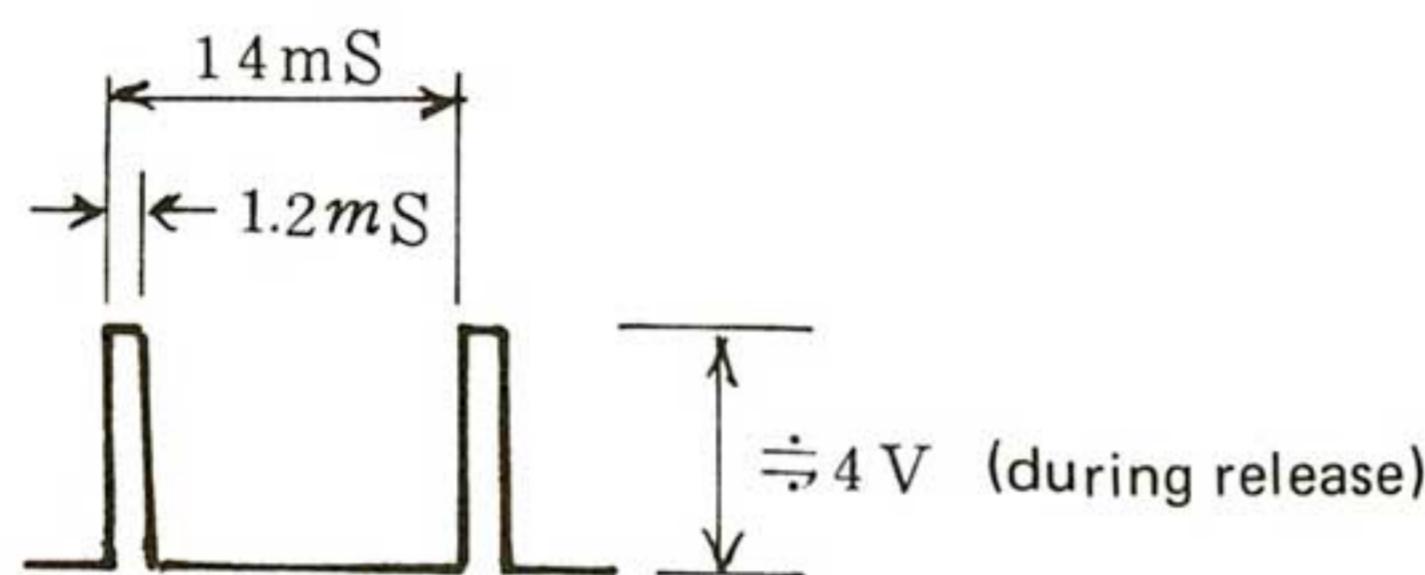

Used to adjust the stylus force.

EXPLANATION OF THE MICROPROCESSOR

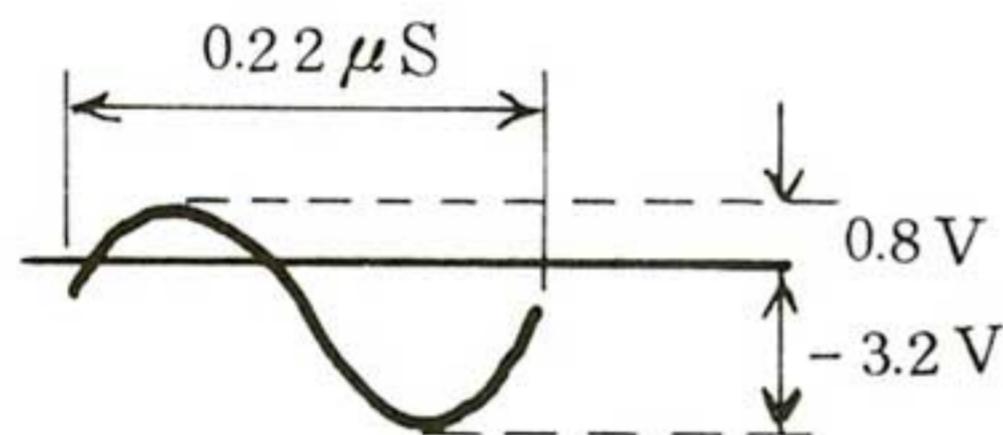

- Motor Control IC . . . IR3T02 (at standard revolution of 33 rpm)

The numbers on the left hand side indicates the terminal number.

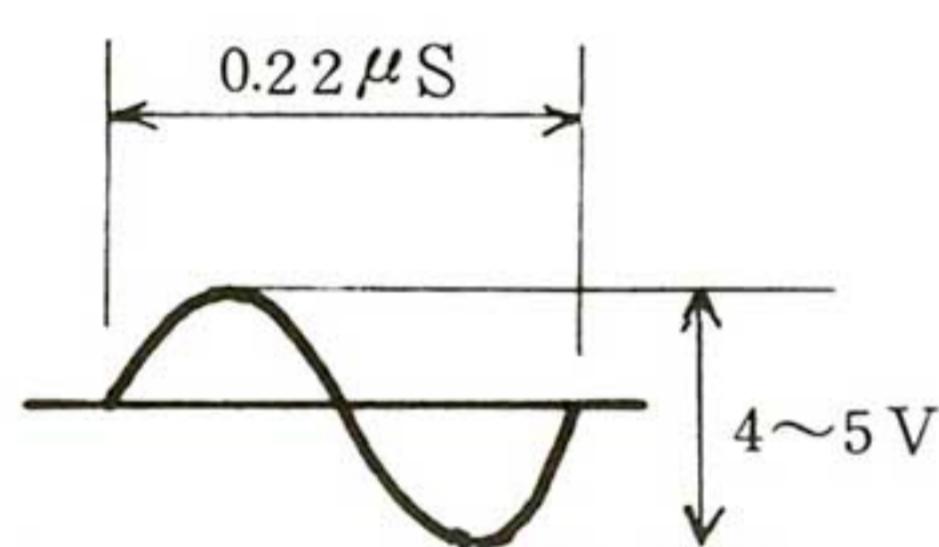

1. strobe drive

2. 4.5MHz OSC

3. 4.5MHz OSC

4. rpm selector

H: 45 rpm
L: 33 rpm

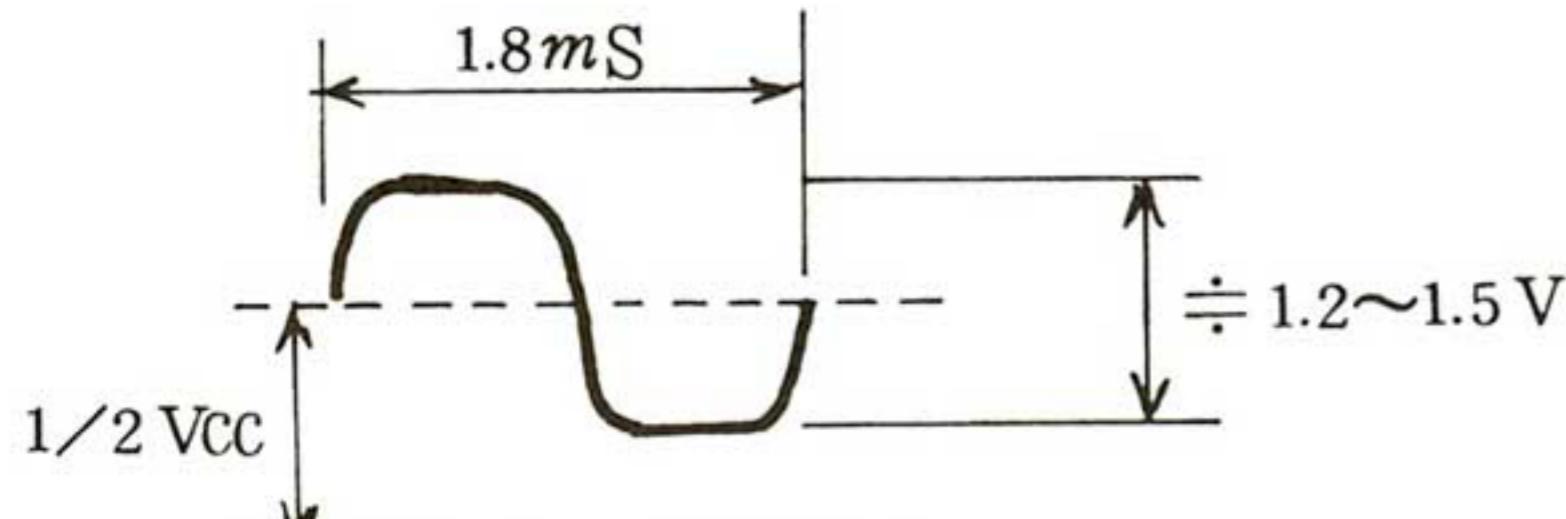

5. power source input

V_{cc} : $5V \pm 0.5V$

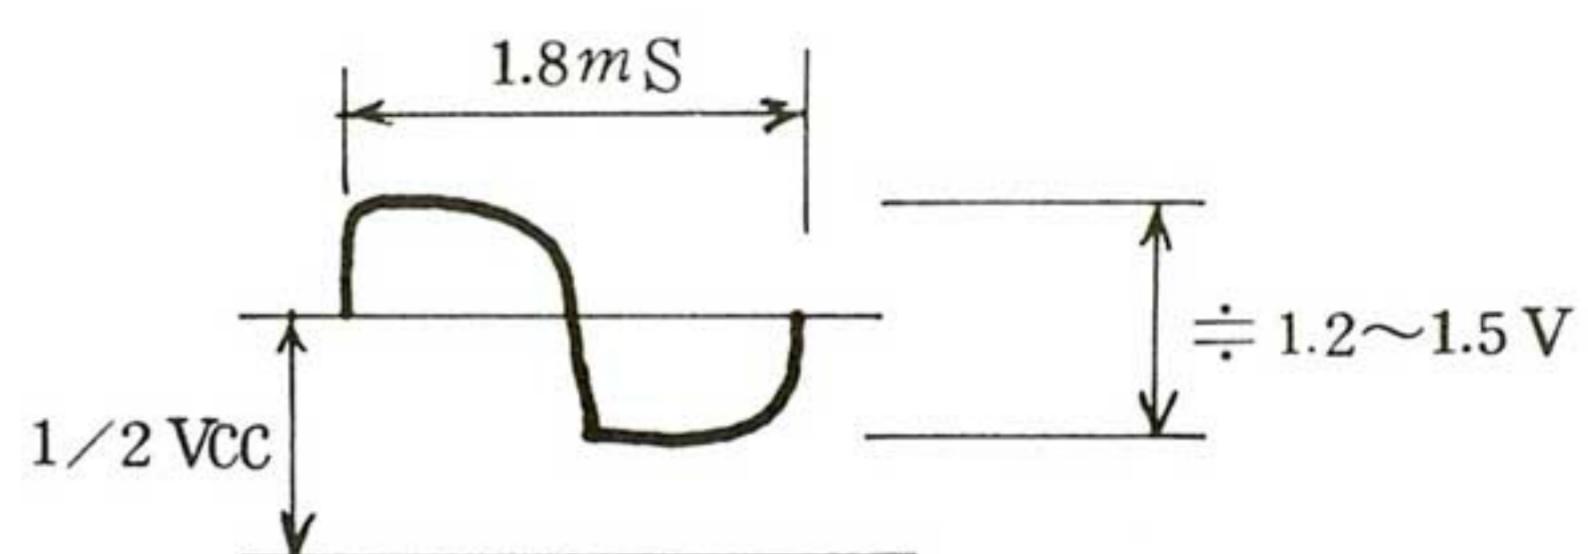

6. FG I bypass terminal

$E6 \div \frac{1}{2} V_{cc}$

7. FG I lowpass terminal

8. FG I output

9. FG I inverse input

The gain set element is connected.
 $E9 \div \frac{1}{2} V_{cc}$

10. FG I non-inverse input

$10mV_{pp} \sim 100mV_{pp}$
 $E10 \div \frac{1}{2} V_{cc}$

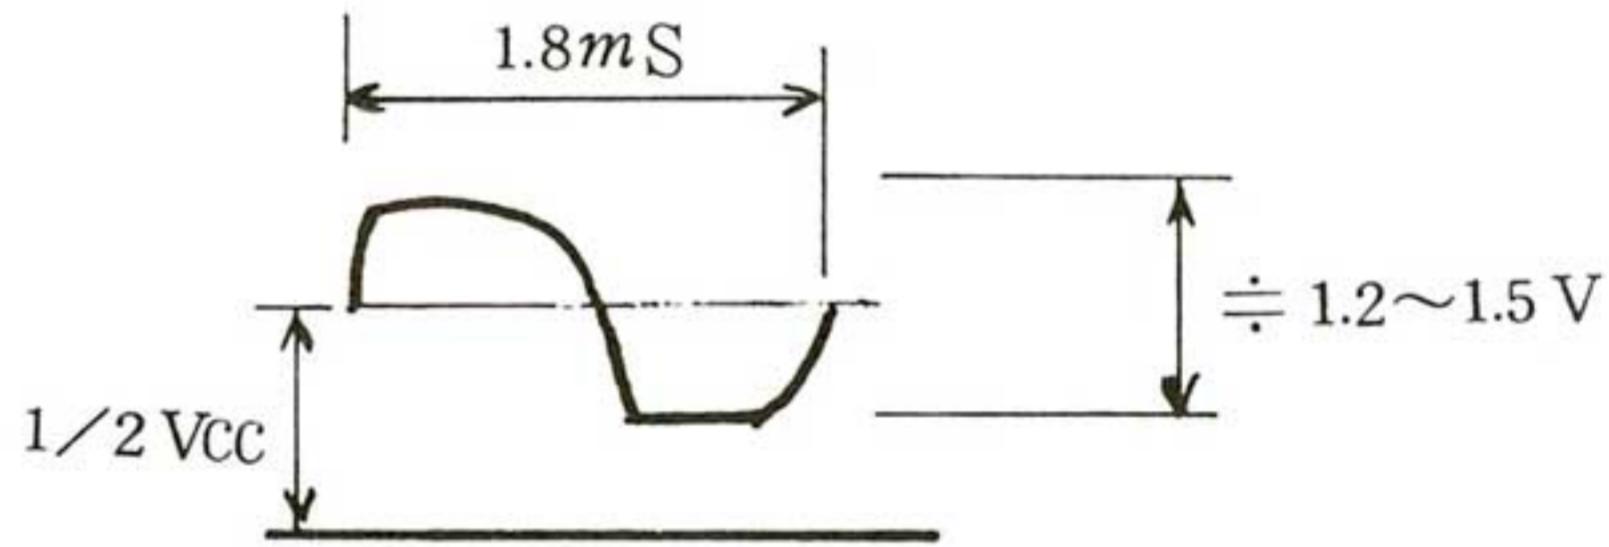

11. FG II non-inverse input

$10mV_{pp} \sim 100mV_{pp}$
 $E11 \div \frac{1}{2} V_{cc}$

12. FG II inverse input

The gain set element is connected.
 $E12 \div \frac{1}{2} V_{cc}$

13. FG II output

14. ground terminal

15. F/V output

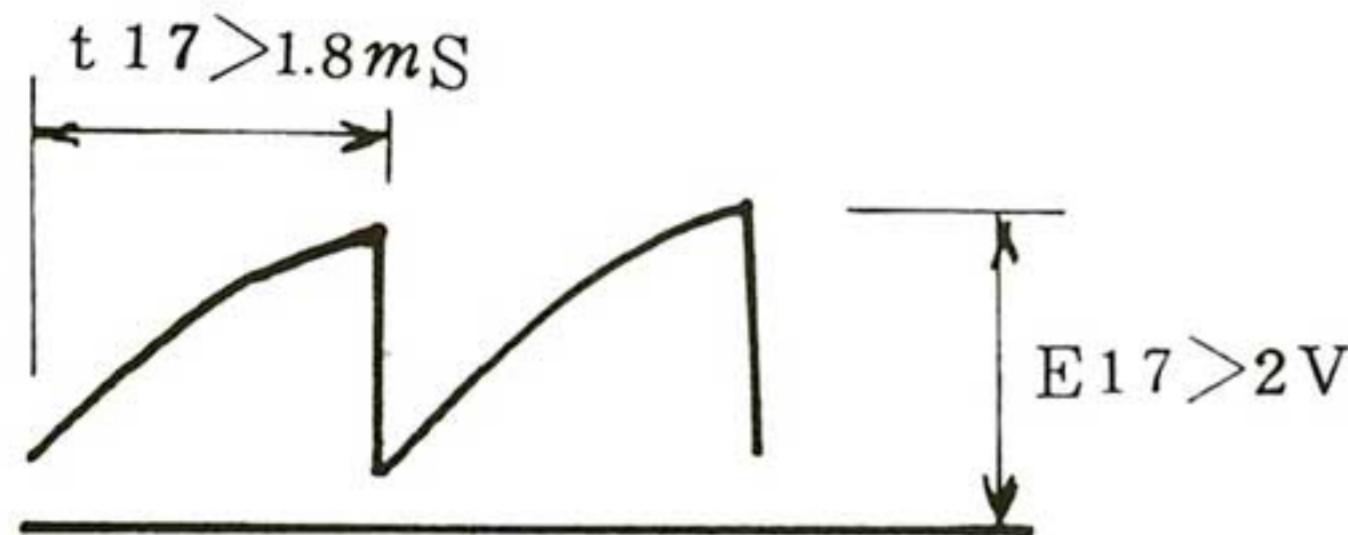

slower than normal revolution: $2 \sim 4.5V$
normal revolution: $\frac{1}{2} 2V$
faster than normal revolution: $0 \sim 2V$

16. F/V hold terminal

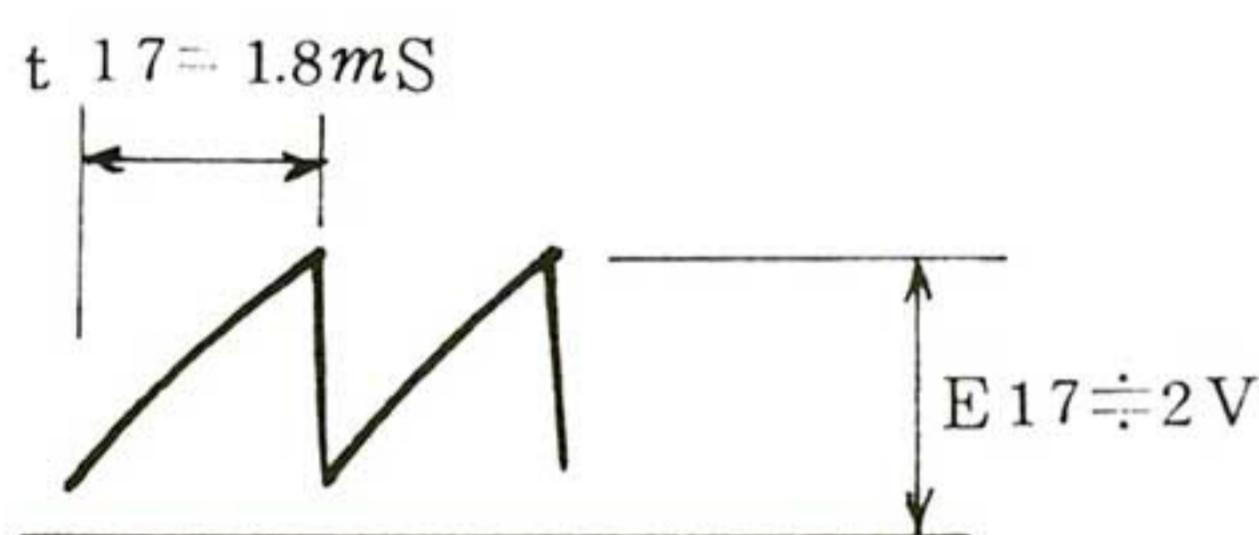

same as terminal 15

17. F/V triangular wave

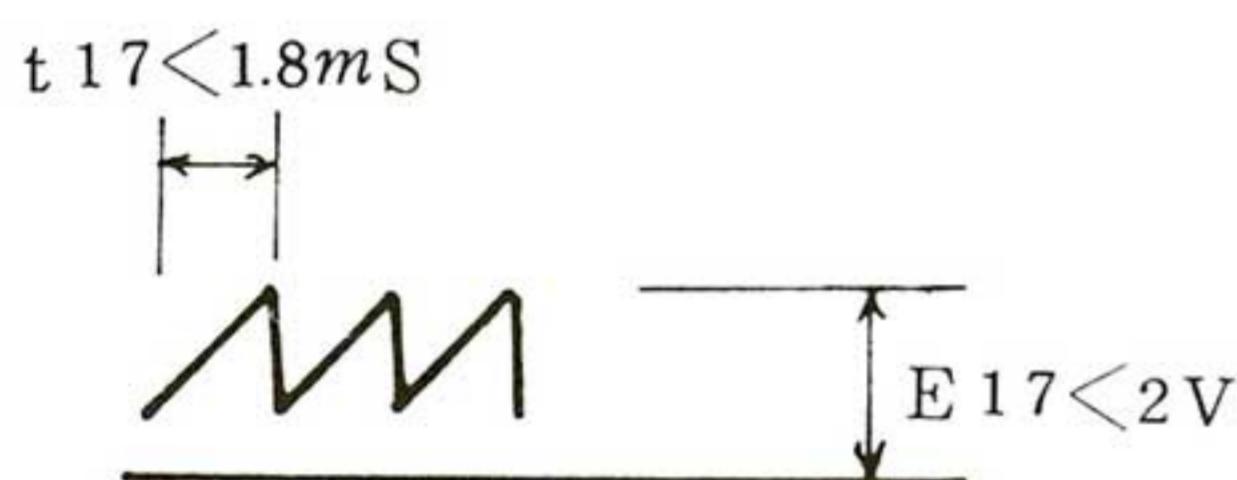

slower than normal revolution

normal revolution

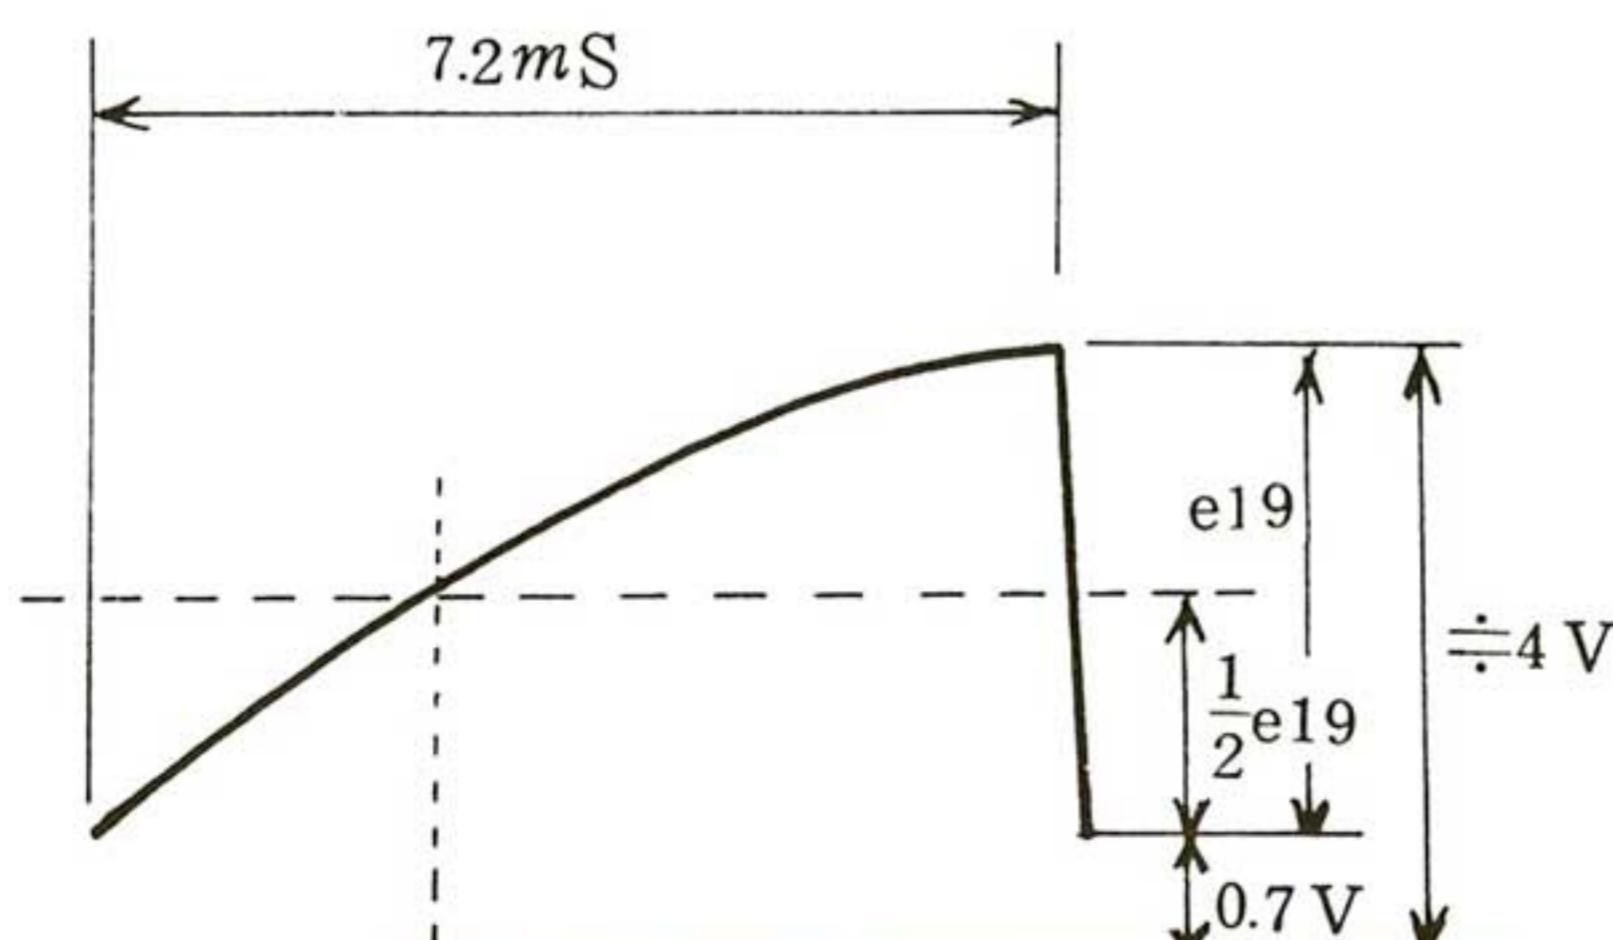

faster than normal revolution

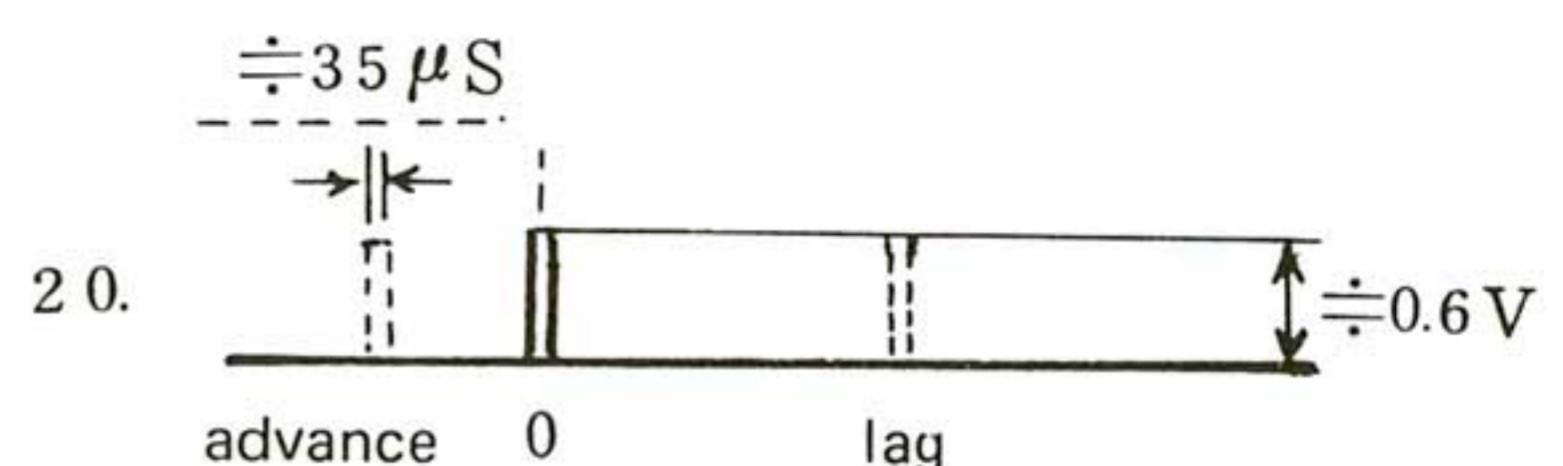

18. timing pulse width-set terminal

$E_{18} \doteq 0.6\text{V}$

19. PD triangular wave

20. sample pulse monitor terminal

21. PD hold terminal

slow phase: $2 \sim 4\text{V}$

normal phase: $\div 2\text{V}$

advanced phase: $1 \sim 3\text{V}$

22. PD output

same as terminal 21

23. Lock detector time set terminal

during lock: 0.6V

lock disengaged: 0V

24. Direction detector output

normal revolution: 0V

reverse revolution: $\div 4\text{V}$

25. Revolution detector

during revolution: $\div 4\text{V}$

stop: 0V

26. START/STOP terminal

$H \rightarrow \text{START}$

$L \rightarrow \text{STOP}$

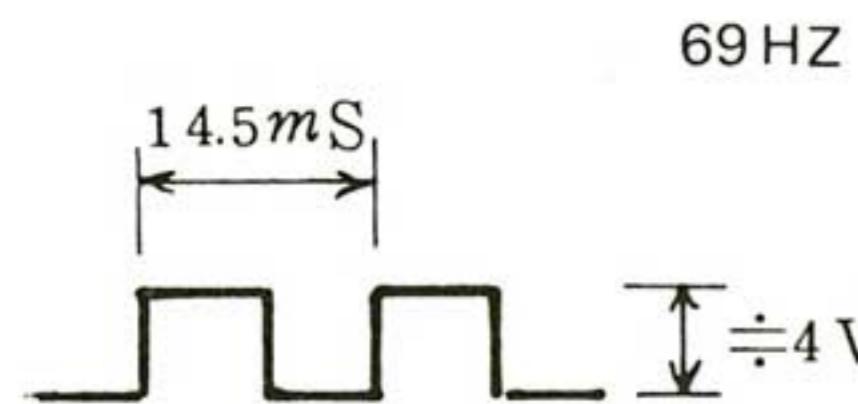

27. Stop output

during stop control: 0V

during start: open

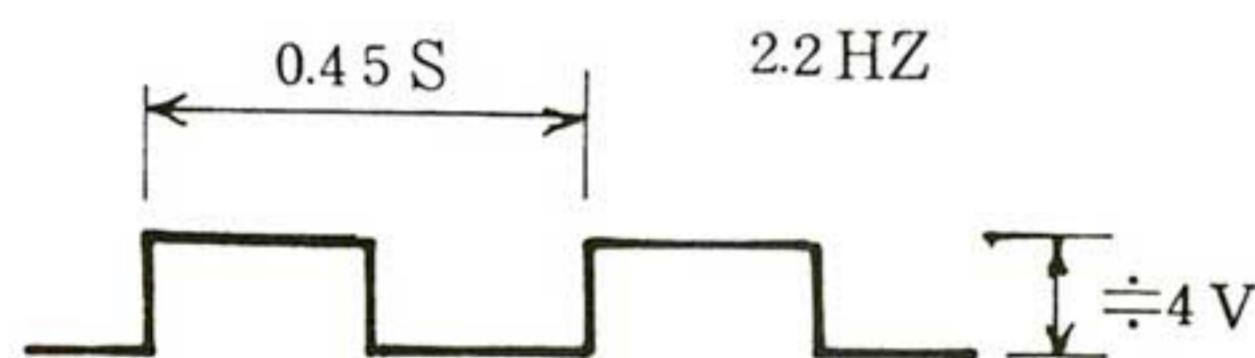

28. Lock indicator

during lock (LED lit dimly)

stop (LED lit)

during transition . . (LED flashes)

• Arm Control IC IR3T03

The numbers on the left side indicates the terminal number of the IR3T03.

1. Acceleration input

Except for the matching range of the lead-in detector ($E7 \leq |\pm 0.6V|$), it will recognize the situation and control the acceleration during automatic tonearm operation.

2. Acceleration output

$E1 \leq |\pm 2.37V \pm 0.1V|$. . . open (will not control the acceleration within the matching range)

$E1 \geq |\pm 2.3V \pm 0.1V|$. . . $E2 \doteq \pm 3.95V$

$-3.95V$: will accelerate toward the inside from rest.

$+3.95V$: will accelerate toward rest from the inside.

3. UP/DOWN selection of the arm lifter

When $E9$ is H, the control output for lifting the arm will be made at $E3 \doteq -V_{cc}$.

When $E9$ is L, the control output for lowering the arm will be made at $E3 \doteq +V_{cc}$.

4. Detection of the rest position

$E4 \leq -2.64V$ will be recognized as the arm being at rest.

5. Detection of the END position

When $E5 \geq 2.64V$, it will be recognized to be within the END detection range.

6. End control

Within the END detection range of 5 (above), ($E5 \geq 2.64V$), the arm will be returned by the END control when $E6 \geq 0.23V$.

7. Matching input

$E7 \leq |\pm 0.6V|$ will be recognized as the match range for lead-in.

8. Drive output

When the T/T drive level is at or near ($E8 \geq |\pm 2.87V|$) full torque in either normal or reverse (brake direction) directions, the current fed into the lifter motor will be limited to increase the stability of the power supply.

9. UP control output

When the lifter is in the UP position during automatic arm operations or when the UP signal is sent by pressing the arm lifter button, pin 9 will be at H level.

$E9H \doteq 4V$

$E9L \doteq 0V$

10. DOWN time constant

To ensure that the arm is lowered completely before proceeding to the next movement, a resistor between pins 9 and 10 and a capacitor on pin 10 has a preset discharge time constant which is somewhat longer than the time required for the arm to be lowered. Thus, when pin 9 becomes L ($E9L \doteq 0V$), and the fixed amount of time elapses, the arm will be recognized to be DOWN as soon as $E10 < 2V$.

11. ANT (Anti-skating) control

When $E10 < 2V$, then $E11 \doteq -4V$ will be the control output needed for the anti-skating to be engaged.

When $E10 \geq 2V$, then $E11 \doteq +4V$ will be the control output needed for the anti-skating to be disengaged.

12. Negative power source

Supplies $-5V$.

13. Lifter control

Besides limiting the drive current to the lift motor to an input of $E8 \geq |\pm 2.87V|$ at pin 8, it is also the lifter motor drive control terminal to stop the lifter movement when it is in the H level and UP position at pin 27.

14. SUB (substratum)

To prevent any interference from the inner elements of the LSI, the substratum terminal is connected to the unregulated side of the negative power source, since it has the lowest electric potential.

15. GND

Standard zero electric potential is the GND.

16. UP SW movement time constant

The UP SW detects the lifter in the UP position. To fill the gap between the completely lifted arm and the UP position as detected by the UP SW, a charge time constant is set by the resistor in the LSI and the capacitor on the outside to stabilize the circuitry. When the lifter is UP: $E16 \doteq 1.2V$, other than up: $E16 \doteq 0V$.

17. Return control

When the stop command is given, or when the repeat is disengaged and the END is detected ($E6 \geq 0.23V$), a control signal output ($E17H > 4V$) is made to return the arm to rest.

$E17H > 4V$

$E17L$: release

18. Horizontal drive control

When the arm is in resting position, or when the arm reaches the lead-in position during automatic play, and comes into the matching range ($E7 \leq |\pm 0.6V|$), a control signal output ($E18H \doteq 4V$) is made to stop the horizontal motion of the arm.

19. Initial set

This is the preparation time setting terminal when the power source is turned on. The resistor in the LSI and the outer capacitor will set the charge time constant and carry out the initial set.

20. LCTD (Located) time constant

The LSI and its outer circuits will set the LCTD time constant to improve the detection accuracy of the lead-in position and the arm rest position.

$E20H \doteq 1.2V$ A few moments after the arm reaches the range of detection, in other words, after the set LCTD time constant elapses, it will become H level, where it is memorized immediately and then reset to the L level.

$E20L \doteq 0V$ Before and after detection, it will become L level.

21. T/T (Turntable) drive control

When the arm reaches the matching range ($E7 \leq |\pm 0.6V|$) of the lead-in position, or when the arm has returned to the rest position, the horizontal drive of the arm is disengaged, after the set time of pin 20 has elapsed. During this time, the turntable will rotate when the arm is not on the arm rest, or it will otherwise stop. Consult the movement explanation for pin 22.

$E21L \doteq 0V$ This will stop the turntable

$E21H$ release This will rotate the turntable

22. T/T (Turntable) starting position

This terminal sets the starting position of the turntable. Connecting pin 22 to GND . . . During automatic play, the turntable will start when the arm reaches the lead-in position, and is in the matching range ($E7 \leq |\pm 0.6V|$). During manual play, the turntable will start when the arm is lifted from the arm rest ($E4 > -2.64V$). This model is operated with this pin 22 at GND.

Opening pin 22 . . . Regardless of automatic or manual play, the turntable will start when the arm is lifted from the arm rest.

23. Start

Will start automatically at the GND level.

24. Auto stop

Will stop automatically at the GND level.

25. Lifter

Will raise the lifter automatically at the GND level.

26. Repeat

Will engage the repeat automatically at the GND level.

27. UP SW

When the arm lifter is raised, this terminal will be opened and made H level, otherwise, the UP detector will control it to make it GND level.

With this model, photo reflectors to detect the presence of reflected light from a light emitting diode and a sensor is placed opposite to the reflector cam. When the lifter is in the UP position, the reflector cam blocks the ray of light, and the raised lifter position is detected, as there is no reflection.

28. Positive power supply

Supplies $+5V$.

ADJUSTMENT PROCEDURES

Measure, using a two-channel oscilloscope using test point (TP) 51 as the ground standard point.

• Adjusting the arm control section

1. Adjusting the horizontal offset

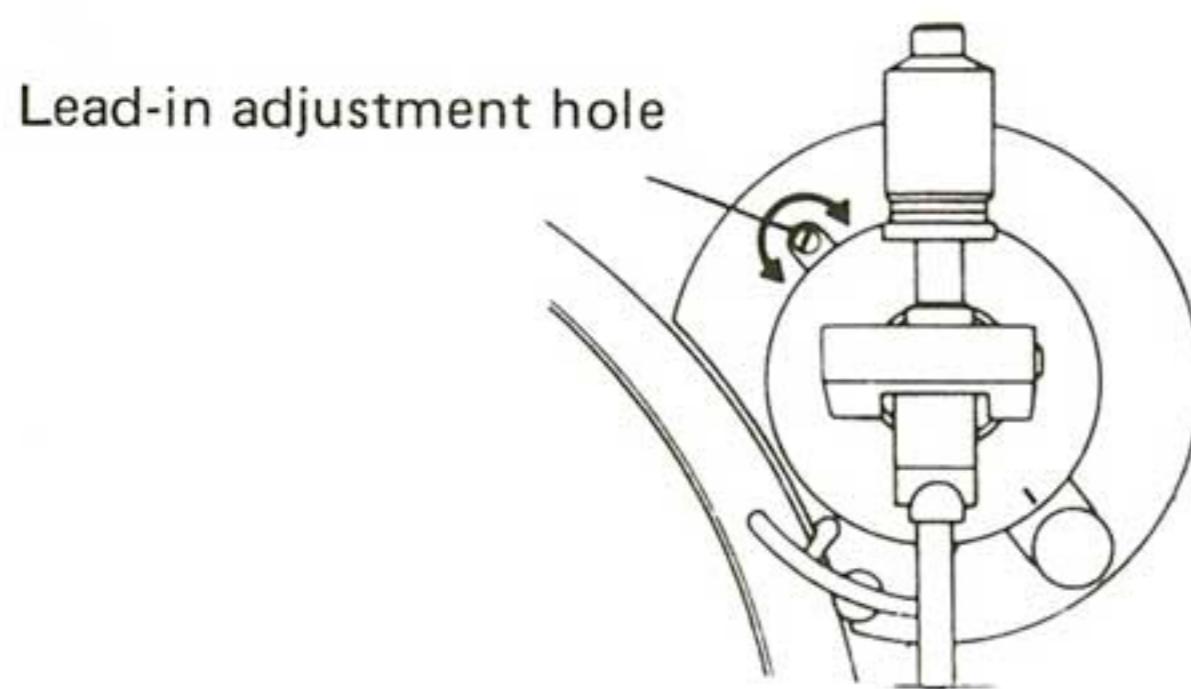

- 1) Fix the tonearm to its rest and connect the oscilloscope to TP 52 .
- 2) Turn VR 9 and adjust to $0 \pm 0.01V$.

2. Adjusting the lifter offset

- 1) With the tonearm on its rest, release the clamp and connect the oscilloscope to TP 54 .
- 2) Turn VR 10 and adjust to $0 \pm 0.1V$.

3. Adjusting the lead-in position for 30cm records

- 1) Set the record size selector to 30cm.
- 2) By continuously pressing start switch S4, the arm will begin to move. Using a small flat head (-) screwdriver, turn and adjust the lead-in adjustment cam on the arm base so that the stylus tip stops at the lead-in position for 30cm records.

- When the stylus is lowered toward the inside, turn the screw counter clockwise (C)
- When the stylus is lowered toward the outside, turn the screw clockwise (Q)

NOTE

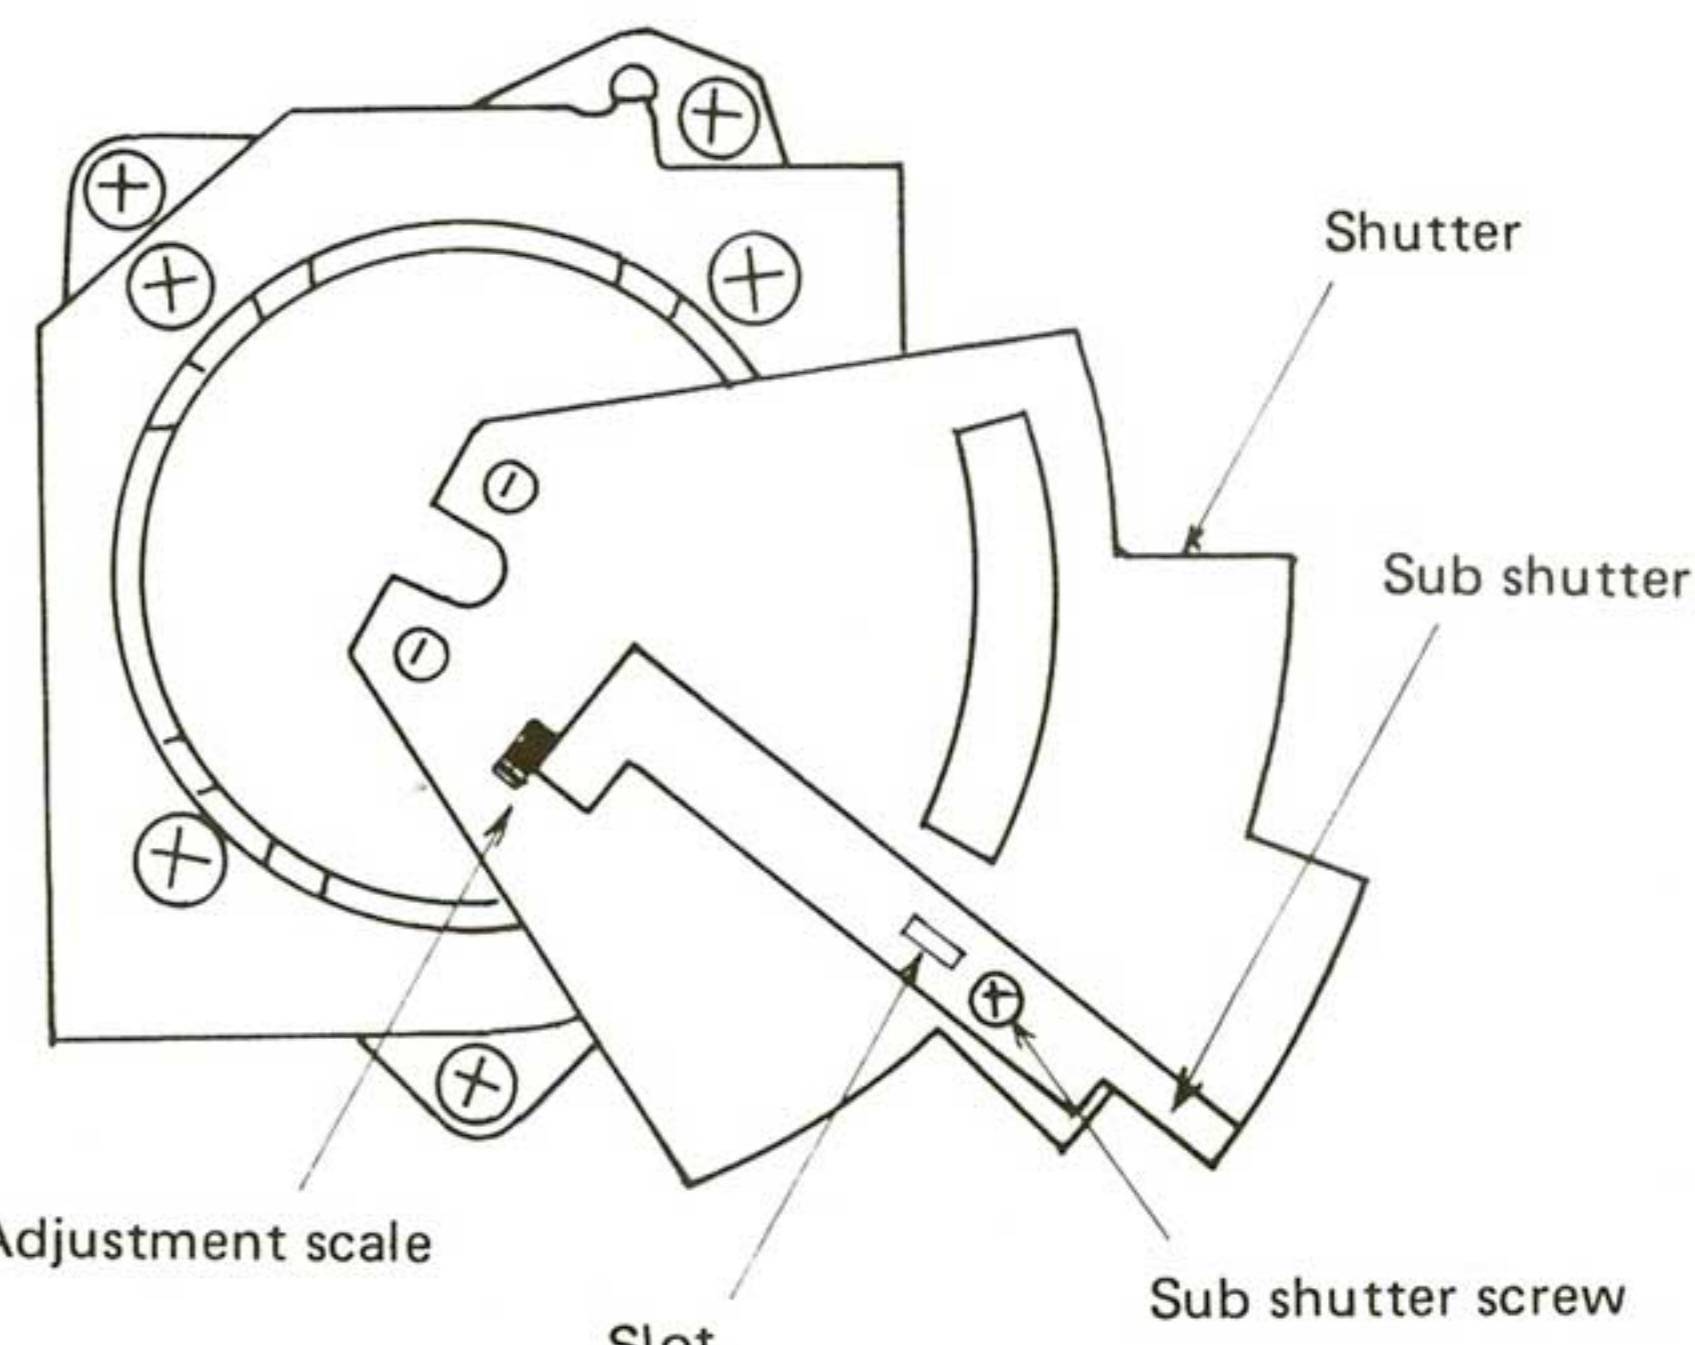

The screwdriver used for this adjustment should have a 4-5mm width tip with a large grip. The shaft diameter should be less than $\phi 5$; when turning the cam, make sure the tip is placed securely in the slot.

4. Adjusting the lead-in position for 17cm records

Adjust as necessary, such as when parts of the sensor section have been replaced.

However, the following procedures should only be used when a discrepancy is found for the 17cm lead-in position, after the 30cm lead-in position has been adjusted.

- 1) Set the record size selector S2 to 17cm.
- 2) By continuously pressing the start switch S4, the arm will move over and stop. At this time, check how many millimeters, toward the inside or outside, the stylus tip deviates from the required 17cm lead-in position.
- 3) Take off the bottom cover of the cabinet and check the adjustment scale position of the shutter. (One adjustment scale corresponds to a stylus tip movement of 5mm.)
- 4) Untighten the screw holding the sub shutter and place a small screwdriver into the slot of the shutter. When the stylus position is toward the inside, compared to the required position, move the sub shutter toward the right of the scale; when the stylus position is toward the outside, move the sub shutter toward the left. When completed, tentatively tighten the screw holding the sub shutter.
- 5) After the adjustments are made, press the start switch S4, and check whether or not the stylus stops at the 17cm lead-in position.
- 6) If the stylus stops at the required position, then tighten the sub shutter screw.

NOTE

If the player is started when the phono motor section has not been adjusted, or when the turntable is not placed in position, the arm will be lead-in and the lifter will be lowered; the phono motor will start to rotate. Sometimes, when the start or stop switch is pressed again, the arm may not move accordingly. This is because when the phono motor current is at its maximum, the lifter does not raise, since the current flow to the lift motor is restricted and the arm does not go into horizontal motion. Thus, it is not due to any mechanical trouble.

• Adjustment of the phono motor section

1. Adjusting the motor amp. offset voltage

- 1) Fix the tonearm to the arm rest and connect the oscilloscope to TP 59 and 60.
- 2) Rotating the turntable by hand, adjust the center of amplitude at TP 59 to $0 \pm 0.1V$ by turning VR 4.
- 3) Following the preceding directions adjust to $0 \pm 0.1V$ by turning VR 3 for TP 60.

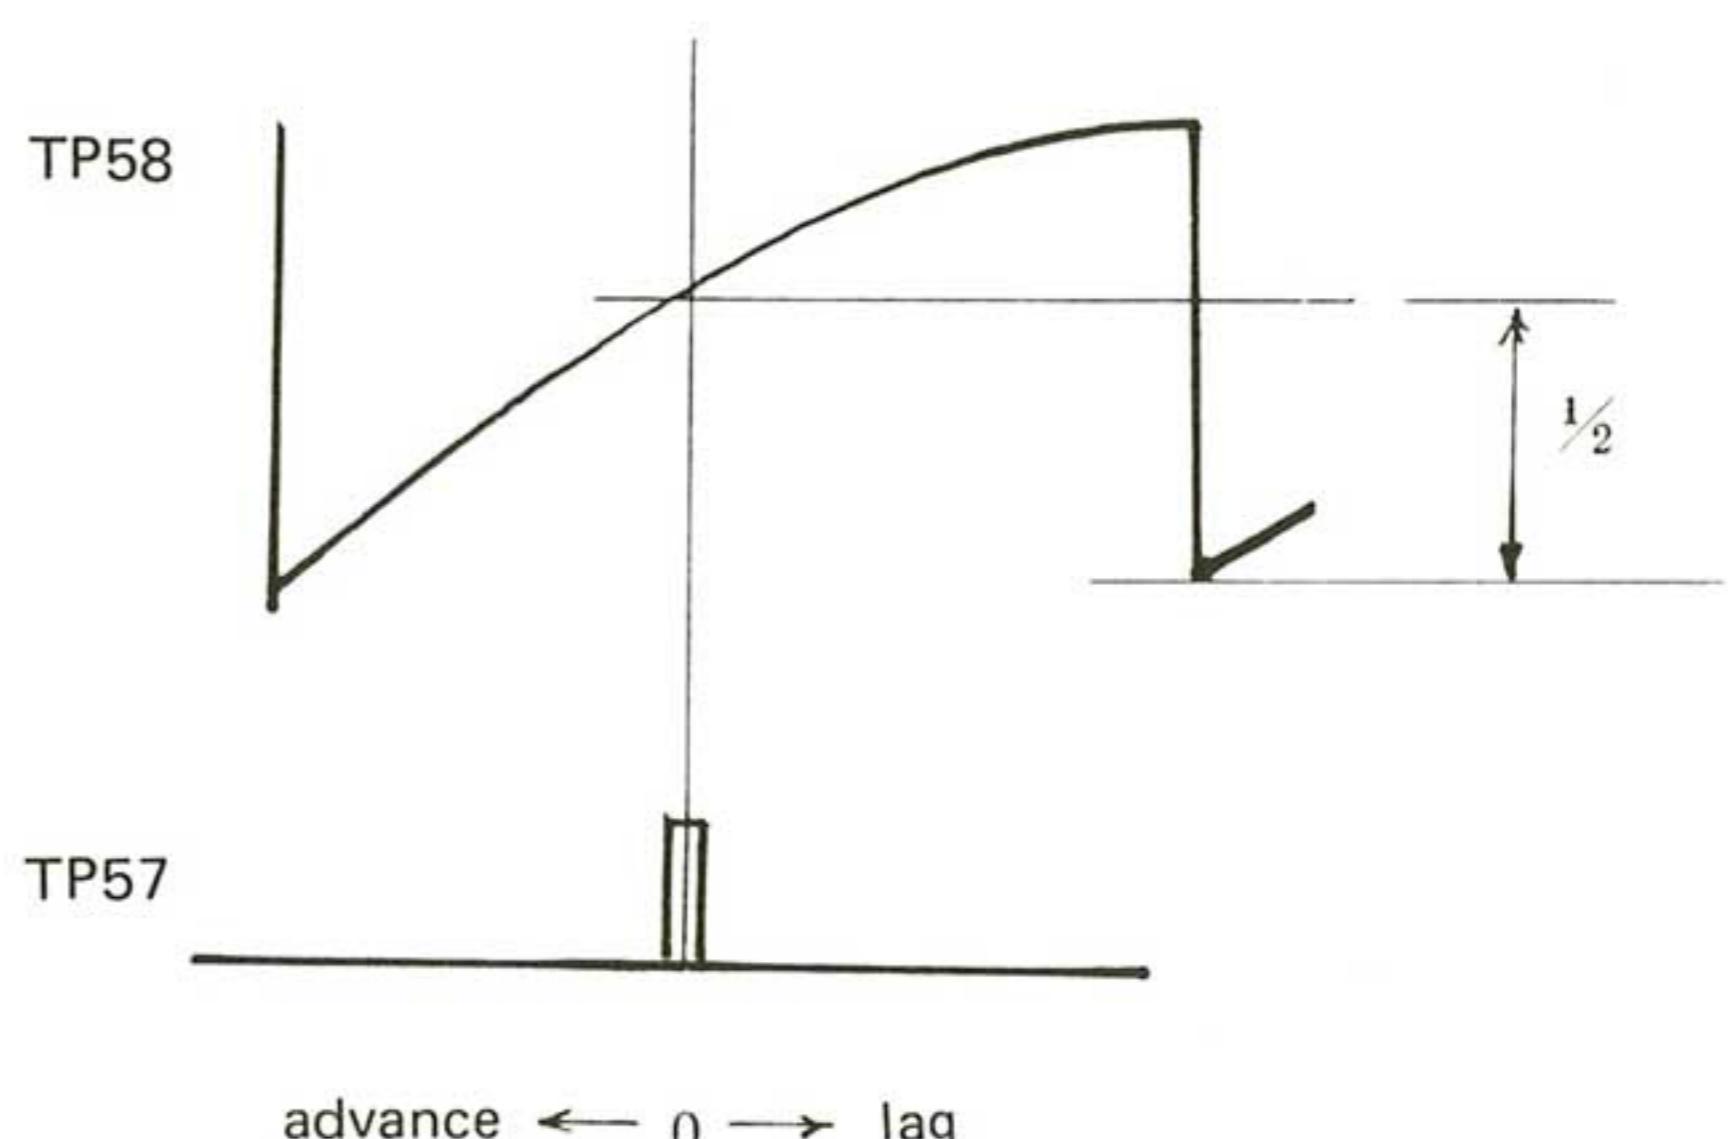

2. Adjusting the motor torque

- 1) Ground TP 56.
- 2) Connect TP 59 and 60 to the oscilloscope.
- 3) Raise the tonearm from the arm rest and rotate the turntable at a fast rate.
- 4) When at TP 59, turn VR 6 and adjust to $15V_{p-p} \pm 0.5V$.
- 5) When at TP 60, turn VR 5 and adjust to $15V_{p-p} \pm 0.5V$.

3. Adjusting the 45 rpm

- 1) Connect TP 57 and 58 to the two-channel oscilloscope.
- 2) Set the speed selector S1 to 45 rpm.
- 3) Take the arm off the armrest and start the phono motor.

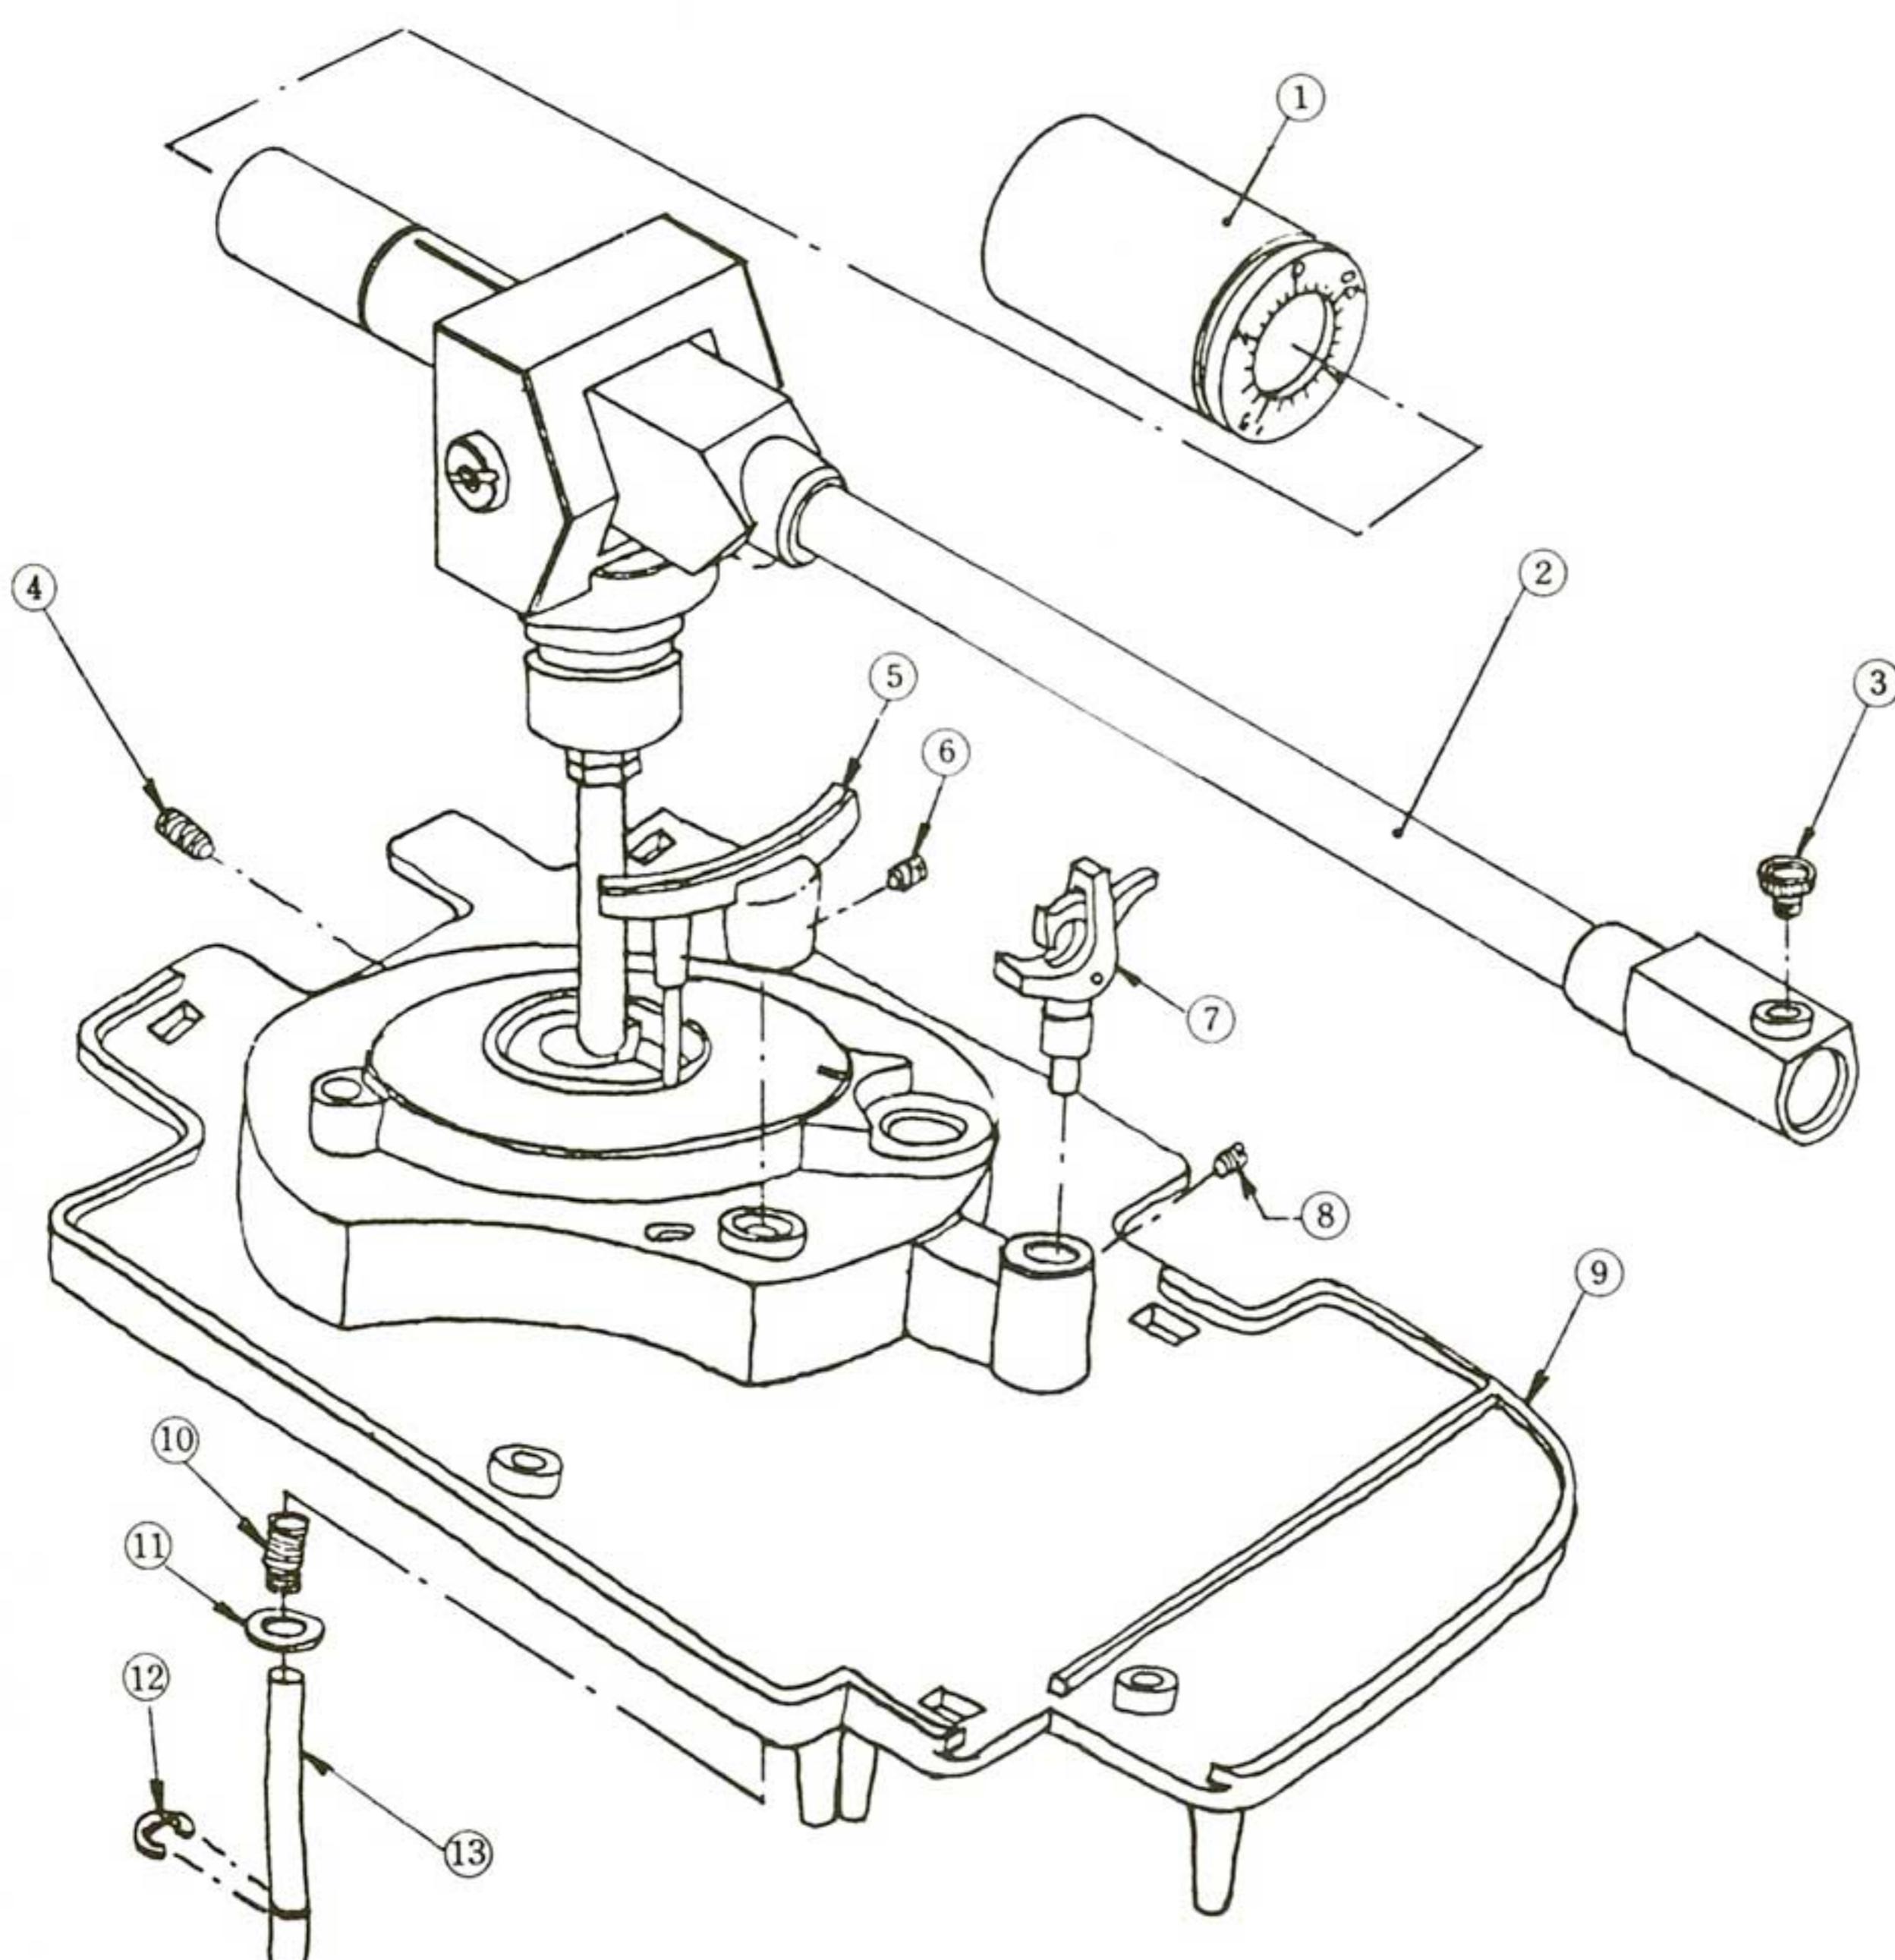

- 4) Adjust VR 2 so that the pulse from TP 57 is positioned at half the amplitude of the triangular wave from TP 58.

4. Adjusting the 33 rpm

- 1) Set the speed selector S1 to 33 rpm.
- 2) As in the adjustments for 45 rpm, adjust VR 1.

EXPLODED VIEW OF MAIN PARTS

CIRCUIT DIAGRAM

C D E F G H

(Note)

- 1.Resistors are in Ω . All the resistors without remarks are $\frac{1}{4}$ W.
- 2.All the capacitors without remarks are in μF .
All the capacitors marked p are in pF.
- 3.Specified components should be used for parts with "/*" marks.
(Temperature compensating parts)

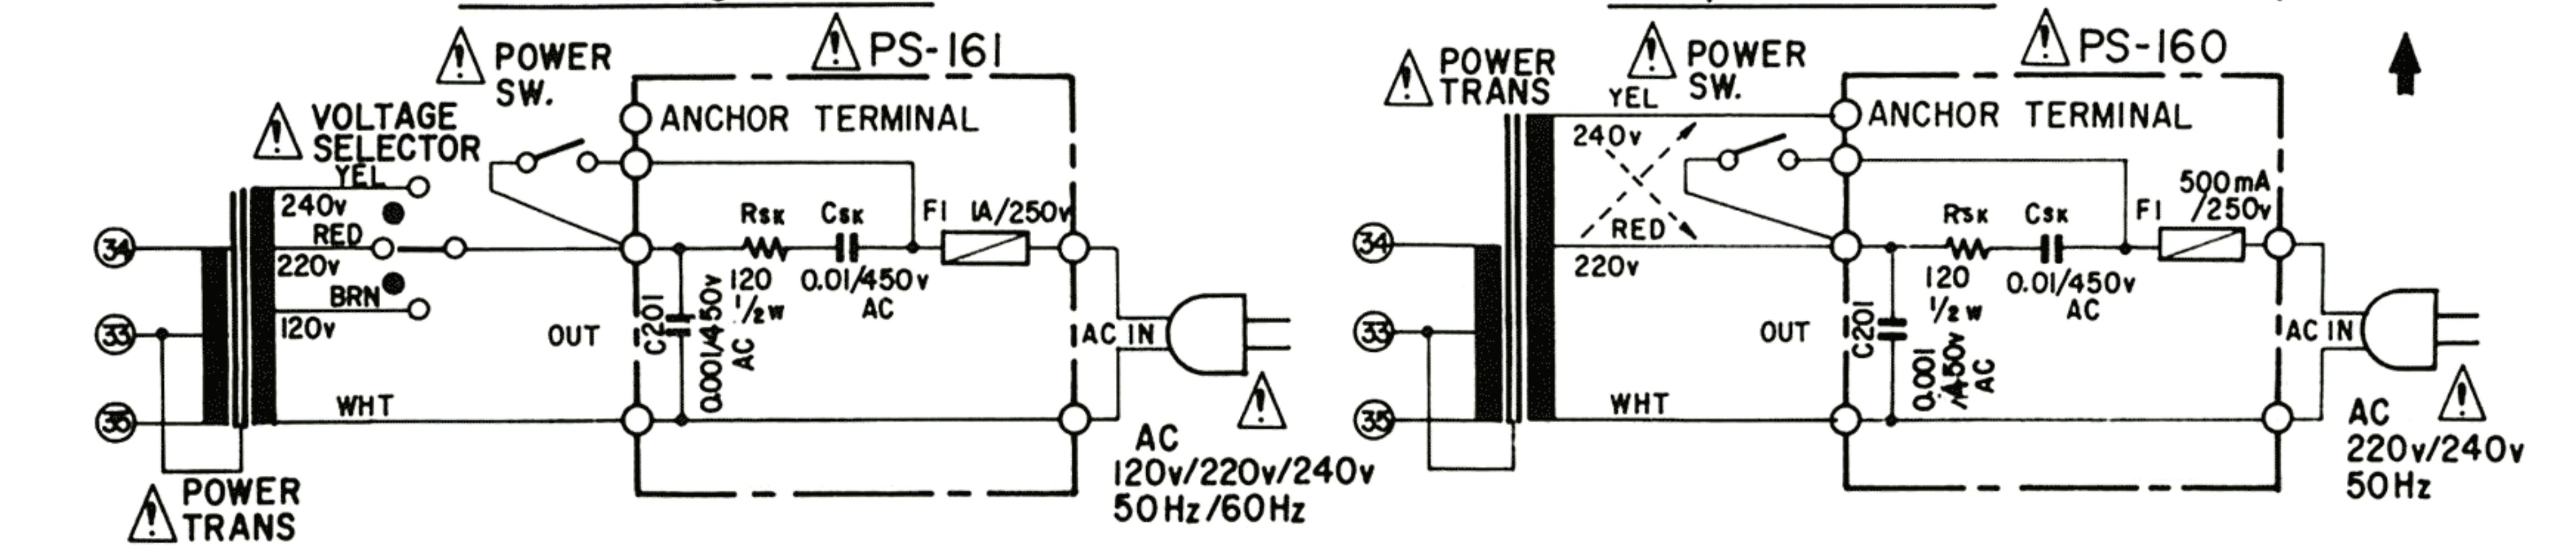

4. All parts and components with "▲" marks have special characteristics important to safety.
Be sure to use the specified parts.
5. The part numbers below denote parts that are not used in the circuit for the DP-31F:
LED 1-7, R3, 4, 68, 76, 96, VR8.
6. The R118 is not used in the circuit for the DP-32F.
